## 1.3 Get Source Code

### 1.3.1 Software Components

digikam project use a single git repository from GitLab to host whole source code base. The project page is given below:

<https://invent.kde.org/graphics/digikam>

The digikam handbook source code is hosted in a separate GitLab repository:

<https://invent.kde.org/documentation/digikam-doc>

## 1.4 Development Environment

If you are a developer with push access to the git repositories, it is strongly recommended to use the "kde:" prefix and let git use the read-only mirrors for pulling.

If you did not clone this repository from "kde:", do it again:

```
git config --global url.git://anongit.kde.org/.insteadof kde:
git config --global url.ssh://git@git.kde.org/.pushinsteadof kde:
git clone kde:digikam
```

See below an example of .gitconfig file working with a developer account:

```
[url "git://anongit.kde.org/"]
    insteadof = kde://

[url "git@git.kde.org:"]
    pushinsteadof = kde://

[url "ssh://git@git.kde.org/"]
    pushinsteadof = kde://

  - **ENABLE\_INTERNALMYSQL** : Build digiKam with internal MySQL server executable (default=ON).
- Showfoto application options
  - **ENABLE\_SHOWFOTO** : Build Showfoto stand-alone image editor application (default=ON).
- Developers only options:
  - **ENABLE\_DIGIKAM\_MODELTEST** : Enable ModelTest on some models for debugging (default=OFF).
  - **ENABLE\_SANITIZERS** : Enable ASAN and UBSAN sanitizers when available (default=OFF).
  - **BUILD\_WITH\_CCACHE** : Use ccache to speed up compilations (default=OFF)

## 1.6 Setup Local Compilation and Run-Time

This section describes how to install digiKam from the git repository, while keeping a system-wide digiKam install.

This procedure is based on the configure script **bootstrap.local**

1. Set the root directory for your git install in bootstrap.local (DIGIKAM\_INSTALL\_PREFIX variable)
2. If you want a clean build directory, set CLEANROOT to 1
3. Type the following command in your terminal:

```
$ ./bootstrap.local # or "./bootstrap.local --eclipse" if you intend to use Eclipse
$ cd build
$ make
$ make install
$ KDESYCOCA="/your/root/directory/var/tmp/kde-$USER/ksycoca5" kbuildsycoca5
```

To run digikam, use the following commands:

```
$ export KDESYCOCA=/your/root/directory/var/tmp/kde-$USER/ksycoca5
$ export QT_PLUGIN_PATH=/your/root/directory/lib64/plugins:/your/root/directory/lib/plugins:$QT_PLUGIN_PATH
$ export XDG_DATA_DIRS=/your/root/directory/share:$XDG_DATA_DIRS
$ /your/root/directory/bin/digikam
```

The same applies for all binaries in /your/root/directory/bin/

If your shell is bash, you can edit your .bashrc file (in \$HOME) and add the following alias:

```
DIGIKAMROOT="/your/root/directory"
alias digikam-dev="KDESYCOCA=\$DIGIKAMROOT/var/tmp/kde-$USER/ksycoca5
XDG_DATA_DIRS=\$DIGIKAMROOT/share:\$XDG_DATA_DIRS
QT_PLUGIN_PATH=\$DIGIKAMROOT/lib64/plugins:\$DIGIKAMROOT/lib/plugins:\$QT_PLUGIN_PATH
\$DIGIKAMROOT/bin/digikam"
```

then you can start your newly installed digikam with

```
$ digikam-dev
```

## 1.7 Debug Traces At Run-Time

digiKam uses categorized logging at run-time. By default, all debug messages are printed on the console. To disable output, you can either fine-grained control by using one or more logging categories listed below.

Note: under Windows, to catch all debug messages you need to install an extra Microsoft application named DebugView available at this url: <http://technet.microsoft.com/en-us/sysinternals/bb896647>. ↩

### 1.7.1 Logging Using an Environment Variable

You can set the environment variable **QT\_LOGGING\_RULES**. Rules are divided by semicolons.

E.g. you can start digiKam like this on the command line with thumbnails and core database messages disabled:

```
export QT_LOGGING_RULES='digiKam.thumbsdb=false;digiKam.coredb=false'
digiKam
```

## 1.7.2 Logging Categories in digiKam

All logging categories are listed in

## 1.8 Cmake compilation rules

### 1.8.1 Introduction

The whole project is written mostly in C++/Qt and the Cmake framework is used to compile under Linux, macOS, and Windows. The Cmake rules have been configured to reduce the linking overhead and improve CPU utilization with modular design.

Independent Cmake configuration is presents in following folders:

- root source dir
- core
- doc

The Cmake rules will build the following targets:

- digikamcore shared lib
- digikamdatabase shared lib
- digikamgui shared lib
- digikam executable
- showfoto executable
- plugin shared libraries (dplugins)
- various test executables - if testing is enabled
- various unit-tests - if testing is enabled

Each of them depend on various sources which must be compiled before. A complete description of source code direction is given to the sourcedirs section.

## 1.8.2 CMake Implementation Details

### 1.8.2.1 Include Directories

Local include directories are all managed by this snippet of code:

```
set(DK_INCLUDES_ALL "")
HEADER_DIRECTORIES(DK_LOCAL_INCLUDES_RAW)
```

The libjpeg- folders are all included, so we need to delete them all and include the correct one only:

```
# This macro will set all paths which do not contain libjpeg-
# We will add later the directory we need
```

```
FOREACH(var ${DK_LOCAL_INCLUDES_RAW})
    STRING(REGEX MATCH "libjpeg-" item ${var})
    IF(item STREQUAL "")
        LIST(APPEND DK_LOCAL_INCLUDES ${var})
    ENDF (item)
ENDFOREACH(var)

set(DK_LOCAL_INCLUDES ${DK_LOCAL_INCLUDES}
    libs/jpegutils/${DIGIKAM_LIBJPEG_DIR})

include_directories(${DK_LOCAL_INCLUDES})
```

There is no need for manual intervention to add new includes, even if you add a new folder, just keep in mind to use:

```
#include "tagmngnrlstitem.h"
```

instead of :

```
#include "models/tagmngnrlstitem.h"
```

### 1.8.2.2 Shared Libraries

To avoid linking overhead and make a better use of sources there are some dynamic libs as these one:

- digikamcore : core components used by almost all executables as digiKam and Showfoto.
- digikamdatabase : database components, also used together with digikamcore but only for digiKam

Please add sources to digikam core or digikam database only if they don't depend on any big component from digikam main executable. These two shared libs must be kept small because they link in a lot of places

### 1.8.2.3 Static Libraries

Currently cmake configuration features a lots of shared libraries as:

- metadataedit
- geolocationedit
- digikamfaceengine

This libraries are linked in digikam main executable and some tests tools.

Avoid making static libraries if possible, and use OBJECT libraries instead. Only make STATIC libraries which does not depend on other digikam code. Also make sure you put the PRIVATE parameter when setting the target\_link\_libraries.

```
target_link_libraries(digikamcore
    PRIVATE
    Qt{QT_VERSION_MAJOR}::Core
    Qt{QT_VERSION_MAJOR}::Gui
    Qt{QT_VERSION_MAJOR}::Widgets
)
```

### 1.8.2.4 Object Libraries

While static libraries are still collection of objects, CMake offer a better approach by allowing to specify an OBJECT library:

```
set(libslideshow_SRCS
  slidetoolbar.cpp
  slideosd.cpp
  slideproperties.cpp
  slideimage.cpp
  slideerror.cpp
  slideend.cpp
  slideshow.cpp
  slidehelp.cpp
  slideshowsettings.cpp
)

add_library(slideshow_src OBJECT ${libslideshow_SRCS})
```

OBJECT library is a cmake internal implementation feature and allow to easily manage sources. Here is an example of how to make a shared lib using OBJECT libraries:

```
add_library(digikamcore
  SHARED
  ${TARGET_OBJECTS:slideshow_src} # the lib we made few lines above
  ${TARGET_OBJECTS:digikamdatabasecore_src}
  ${TARGET_OBJECTS:dimg_src}
  ....
)
```

## 1.9 Contribute To The Code

This section's purpose is to guide contributors and developers to help on the digiKam project.

### 1.9.1 Starting With Open-Source

Before to contribute to digiKam project, please take a look to this link which provide 10 golden rules for starting with open source project:

[http://schlitt.info/opensource/blog/0541\\_10\\_golden\\_rules\\_for\\_starting\\_with\\_open\\_source.html](http://schlitt.info/opensource/blog/0541_10_golden_rules_for_starting_with_open_source.html)

### 1.9.2 Source Code Formatting

Adhere to this style guide strictly while adding new code to digiKam or working on existing code.

#### 1.9.2.1 Indentation length

Indent with 4 spaces exactly.

For example:

```
void function()
{
  ....int a; // 4 spaces from beginning
  ....for (int i = 0 ; i < 10 ; ++i) // 4 spaces from beginning
  ....{ // 4 spaces from beginning
  .....a = i; // 4 spaces from previous indent block
```

Emacs by default will indent to 4 spaces vim users add this to you .vimrc set tabstop=4

### 1.9.2.2 Tabs vs Spaces

Absolutely no tabs. Use a sensible editor which will convert tabs to spaces. This will reduce unnecessary changes in your git commits.

Emacs by default will convert tab to spaces. For vim users, add this to your .vimrc set expandtab

### 1.9.2.3 Line length

Line length should never exceed 80 chars (unless really necessary - these cases are rare). Having long lines greatly reduces readability of code

### 1.9.2.4 Bracketing

In all cases, {} brackets should start on a newline and should be aligned with previous line (follow the indentation spaces). For example.

```
class A
{ //new line
...

for (int i = 0 ; i < 10 ; ++i)
{ //new line

if (a == foobar)
{ //new line
...
}
else
{ // new line
..
}
```

### 1.9.2.5 Positioning of Access modifiers

public, private, protected, public slots, ... should be aligned to the beginning of the line with no margin

```
class A
{
public: // aligned to left
...
private Q_SLOTS: // aligned to left
```

Follow a consistent order in defining these attributes. The recommended order is public, protected (functions), private (functions), signals, public slots, protected slots, private slots, private (variables)

## 1.9.3 Class, file and Variable names

### 1.9.3.1 Class and filenames

- filenames should always be in lower-case
- class names should match the filenames. Capitalize the first letter and other letters logically to improve readability

### 1.9.3.2 Protected Member variables

- protected member variable names should always be of the form `m_varName`.
- Capitalize logically so that it becomes easy to read it. Do not capitalize the first letter after `_` (Use `m_varName` not `m_VarName`)
- variable names should be indicative of their functionality and also of the type they belong too if they are instances of qt widgets. For example, `QCheckBox* m_autoRotateCheckBox`;

### 1.9.3.3 Non-Member variables

- non-member variables should follow the same naming convention as the member variables, except for the leading `m_`

### 1.9.3.4 Private Member variables

- private member variables must be stored in a `d` private container to reduce compilation time and improve binary compatibility between digiKam components. See more information how to use a 'd' private class at this url:

[https://community.kde.org/Policies/Library\\_Code\\_Policy](https://community.kde.org/Policies/Library_Code_Policy)

## 1.9.4 Comments and Whitespace

Use whitespaces liberally to improve readability. Add blank lines between logical sections of the code.

Comment as much as possible. Position comments at the beginning of the section/line you want to comment, NEVER at the end of the line, excepted for special cases for ex to describe enum values.

```
// put your comments here
a = (b == foobar) ? 1 : -1;

a = (b == foobar) ? 1 : -1; // you are asking for trouble by putting comments here
```

## 1.9.5 Header Files

- Add copyright to top of every file. Use the same header than others digiKam source code.
- Add double inclusion protection

```
#pragma once

class AnotherNiceClass
{
...
}
```

- Use forward declarations as much as possible.

```
class QFileInfo;

class A
{
...QFileInfo* m_fileInfo = nullptr;
```

## 1.9.6 Automatic source code formatting

The above coding style guidelines can be automatically applied with `astyle` (<http://astyle.sourceforge.net/>).

Run it in the directory where the files are located that should be formatted.

To apply the coding guidelines with `astyle` is to use the `fileformatter.py` script in `project/scripts` directory. This script will also clean up the source tree and remove backup files that had been created by `astyle`, if the appropriate command line argument is given.

To handle the command easier, create a bash function in `~/.bashrc`, e.g.

```
dkfrmcode()
{
    astyle --style=allman \
          --indent=spaces=4 \
          --convert-tabs \
          --indent-switches \
          --break-blocks \
          --break-closing-brackets \
          --pad-header \
          --align-pointer=type \
          --indent-coll-comments \
          --add-brackets \
          --min-conditional-indent=0 \
          `find $1 -type f -name '*.cpp'` `find $1 -type f -name '*.c'` `find $1 -type f -name '*.h'`
}

```

You can pass a parameter to the function, in this case the first parameter is the directory, where files should be formatted.

Examples:

1. Run `astyle` in the current directory
 

```
$> dkfrmcode
```
2. Run `astyle` in a different directory
 

```
$> dkfrmcode /home/user/code/git/digikam/
```

## 1.9.7 General recommendations

Please take a look into this contrib page tips before to write code/patches for digiKam project : <http://techbase.kde.org/Contribute>

Use the same `.cpp/.h` header than the rest of digiKam project.

Use a decent editor which does auto-indentation/syntax-highlighting for you, as Kate or QtCreator

There are excellent initializer scripts in the `kdesdk` package for `xemacs` and `vim` which can substantially increase your productivity.

Just to give a taste of what i can do with `emacs` (and `kdesdk`):

automatically insert copyright (and `ifdefs`) in new files. insertion of class function definitions for declared class functions in header with one keystroke switch between header and declaration files with one keystroke go to corresponding definition/declaration with one keystroke tab completion of variable/function names already declared.

## 1.9.8 GDB Backtrace

If you found a context to crash digiKam, you can provide a backtrace using GDB debugger. digiKam need to be compiled with all debug info else the backtrace will not suitable. There is a configure option for that:

```
$> cmake . -DCMAKE_BUILD_TYPE=debugfull
$> make
$> su
$> make install/fast
```

To make a backtrace with GDB use following command:

```
$ gdb digikam
> catch throw
> run
> ...
> _crash here_
> ...
> bt
> _the backtrace is here_
> quit
```

Post this backtrace at the right place (Bugzilla or development mailing list) for investigation by developers.

For Windows users, take a look on this tutorial :

[http://techbase.kde.org/Development/Tutorials/Debugging/Debugging\\_on\\_MS\\_Windows](http://techbase.kde.org/Development/Tutorials/Debugging/Debugging_on_MS_Windows)

## 1.9.9 Memory Leak

To check any memory leak problem in digiKam, valgrind is your friend ( <http://valgrind.org>) Try this command line to use with valgrind :

```
valgrind --tool=memcheck --leak-check=full --error-limit=no --suppressions=project/reports/digikam.supp digikam
```

NOTE: digikam.supp file is available in digikam/project sub-folder.

## 1.9.10 Profiling With Cachegrind

Valgrind also includes a tool to find out in which parts of your code time is spent.

```
valgrind --tool=callgrind digikam
```

Profiling can be disabled at startup to limit the output to the code you are interested in. Start with

```
valgrind --tool=callgrind --instr-atstart=no digikam
```

and prepare the situation you want to profile. Then, in another console, start profiling with "callgrind\_control -i on" and, after the situation has passed, request a profile dump with "callgrind\_control -d". The resulting callgrind.out files need to be viewed with the kcachegrind program, e.g.:

```
kcachegrind callgrind.out.16693.1
```

## 1.9.11 Unit Testing / Automated Testing

Unit Testing is great way to ensure that software units (in OOP this normally means classes) work as expected. Wikipedia gives a good introduction to Unit Testing:

[http://en.wikipedia.org/wiki/Unit\\_testing](http://en.wikipedia.org/wiki/Unit_testing)

It is also worth to follow most of QTest API rules with digiKam:

<http://doc.qt.io/qt-5/qtest-tutorial.html>

The digiKam test suite is located under tests and will be compiled if BUILD\_TESTING is turned ON at cmake configuration time. After compiling the source code the tests can be executed via

```
make test
```

The console output while running the tests is stored in Testing/Temporary/LastTest.log in the CMake binary dir.

All tests are simple binaries that can be executed separately if needed.

### 1.9.12 Checking For Corrupt Qt Signal Slot Connection

Use this alias for running digikam:

```
alias digikamdbg="digikam 2>&1 | tee - /tmp/digikam.out; echo -e \"\n\nPossible connection errors:\n\n\";
cat /tmp/digikam.out | grep -A2 'Object::connect'"
```

It will print a list of connection warnings after terminating the program. Moreover the complete console log of the last session is stored in /tmp/digikam.out.

### 1.9.13 Finding Duplicated Code

Code duplication should be avoided as bugs have to be fixed for every piece of duplicated code. The current duplication can be analyzed eg. with Simian: <http://www.redhillconsulting.com.au/products/simian/>

In the digikam checkout directory run:

```
java -jar simian.jar `find . -regex '.*\.(cpp|\.h)' | grep -v 3rdparty`
```

This prints out a list of duplicated code segments.

### 1.9.14 API Documentation Validation, User Documentation Validation, Source Code Checking

The following site check on a daily basis for the a.m. errors: [www.englishbreakfastnetwork.org/krazy/](http://www.englishbreakfastnetwork.org/krazy/)

It can be very useful, in particular before major releases. Don't trust it blindly! Sometimes they propose too advanced modifications that are no compatible with the prevailing include files.

### 1.9.15 Usability Issues

OpenUsability project has define default menu structure and keyboard shortcuts:

[http://wiki.openusability.org/guidelines/index.php/Appendices:Keyboard\\_Shortcuts](http://wiki.openusability.org/guidelines/index.php/Appendices:Keyboard_Shortcuts)

### 1.9.16 Generate API Documentation

To generate API documentation, you need to install:

- Doxygen program ( <http://www.doxygen.org>)
- Dot program ( <http://www.graphviz.org>)
- TeXLive package full version to generate the API doc in PDF ( <https://tug.org/texlive/>)

Under Ubuntu run:

```
sudo apt install doxygen graphviz texlive-full
```

After cmake generated a Makefile you can call 'make doc'. A new subfolder named 'html' will be created. Warning, this can take a while.

For finding documentation errors, doxygen generates a warning log file at the cmake binary dir called 'doxygen-warn.log'.

### 1.9.17 Speed Up The Code-Compile-Test Cycle

Assuming you have setup your environment in `~/.bashrc` as is suggested for development, you can add something like this to your `~/.bashrc`:

```
function digikam_start
{
LD_LIBRARY_PATH=${KDE_BUILDD}/extragear/graphics/lib:${LD_LIBRARY_PATH}
  ${KDE_BUILDD}/extragear/graphics/digikam/digikam/digikam
}

function digikam_start_gdb
{
LD_LIBRARY_PATH=${KDE_BUILDD}/extragear/graphics/lib:${LD_LIBRARY_PATH} gdb
  ${KDE_BUILDD}/extragear/graphics/digikam/digikam/digikam
}
```

This allows you to run digikam after compiling without the need of a "make install", even if you changed code in the libraries.

### 1.9.18 Working With Branches From Git Repository

Example to create a local 'dplugins' development branch based on master:

```
git checkout master
git checkout -b development/dplugins
```

Example to delete the local 'dplugins' development branch:

```
git checkout master
git branch -d development/dplugins
```

Example to create a remote 'dplugins' development branch from the local branch:

```
git push -u origin development/dplugins
```

Example to delete the remote 'dplugins' development branch:

```
git push origin :development/dplugins
```

### 1.9.19 Sync a Branch With Master From Git Repository

It typical to use a dedicated development branch in Git to keep the master code stable for production. To synchronize branches with master, use these commands in your local branch checkout:

```
$>git checkout master
$>git pull --rebase
$>git checkout -b MY_DEVEL_BRANCH GIT_REMOTE_PATH
  Branch 'MY_DEVEL_BRANCH' set up to track remote branch path 'GIT_REMOTE_PATH' from origin.
  To list GIT_REMOTE_PATH, use 'git branch -a' command
  Switched to a new branch 'MY_DEVEL_BRANCH'
$>git merge master
  Merge made by the 'recursive' strategy.
  ...
$>git push
  ...
```

The first 2 lines make sure that your local master repository is up to date. The 3rd line creates the local development branch "MY\_DEVEL\_BRANCH". If you have already created this branch, just run "git checkout MY\_DEVEL\_BRANCH". Merging between master and "MY\_DEVEL\_BRANCH" branch is done in the 4th line. Git might ask you to resolve conflicts here. When it's done, it will ask you to provide a commit message. Finally you push your merge into the remote repository.

Digikam::ProgressManager	
The <a href="#">ProgressManager</a> singleton keeps track of all ongoing transactions and notifies observers (progress dialogs) when their progress percent value changes, when they are completed (by their owner), and when they are canceled. Each <a href="#">ProgressItem</a> emits those signals individually and the singleton broadcasts them. Use the <a href="#">createProgressItem()</a> statics to acquire an item and then call <code>-&gt;setProgress( int percent )</code> on it every time you want to update the item and <code>-&gt;setComplete()</code> when the operation is done. This will delete the item. Connect to the item's <a href="#">progressItemCanceled()</a> signal to be notified when the user cancels the transaction using one of the observing progress dialogs or by calling <code>item-&gt;cancel()</code> in some other way. The owner is responsible for calling <code>setComplete()</code> on the item, even if it is canceled. Use the standard <code>CancelHandler()</code> slot if that is all you want to do on cancel

The [ProgressManager](#) singleton keeps track of all ongoing transactions and notifies observers (progress dialogs) when their progress percent value changes, when they are completed (by their owner), and when they are canceled. Each [ProgressItem](#) emits those signals individually and the singleton broadcasts them. Use the [createProgressItem\(\)](#) statics to acquire an item and then call `->setProgress( int percent )` on it every time you want to update the item and `->setComplete()` when the operation is done. This will delete the item. Connect to the item's [progressItemCanceled\(\)](#) signal to be notified when the user cancels the transaction using one of the observing progress dialogs or by calling `item->cancel()` in some other way. The owner is responsible for calling `setComplete()` on the item, even if it is canceled. Use the `standardCancelHandler()` slot if that is all you want to do on cancel.

### 5.1.2 Typedef Documentation

#### 5.1.2.1 ActionJobCollection

```
typedef QHash<ActionJob*, int> Digikam::ActionJobCollection
```

Define a QHash of job/priority to process by [ActionThreadBase](#) manager. Priority value can be used to control the run queue's order of execution. Zero priority want mean to process job with higher priority.

### 5.1.2.2 BatchSetList

```
typedef QList<BatchToolSet> Digikam::BatchSetList
```

An indexed map of batch tools with settings.

### 5.1.2.3 BatchToolSettings

```
typedef QMap<QString, QVariant> Digikam::BatchToolSettings
```

A map of batch tool settings (setting key, setting value).

### 5.1.2.4 BatchToolsList

```
typedef QList<BatchTool*> Digikam::BatchToolsList
```

A list of batch tool instances.

### 5.1.2.5 DateRange

```
typedef QPair<QDateTime, QDateTime> Digikam::DateRange
```

Range of a contiguous dates selection <start date, end date>.

### 5.1.2.6 DateRangeList

```
typedef QList<DateRange> Digikam::DateRangeList

```

Map container of widget parameter name/value.

### 5.1.2.8 DItemsListIsLessThanHandler

```
typedef bool(* Digikam::DItemsListIsLessThanHandler) (const QTreeWidgetItem *current, const
QTreeWidgetItem &other)
```

Type of static function used to customize sort items in list. Sort items call this method in `DItemsListViewItem::operator<`. To setup this method, uses `DItemList::setIsLessThanHandler()`.

### 5.1.2.9 QueuePoolItemsList

## 5.1.3.4 GeoGroupStateEnum

```
enum Digikam::GeoGroupStateEnum
```

The idea is that a group consists of more than one object. Thus the resulting state is that either none of the objects, some or all of them have a certain state. The constants for each state are set up such that they can be logically or'ed: If a group has the state `___All`, and another the state `___Some`, the bit representing `___Some` is always propagated along. You only have to make sure that once you reach an object with `___None`, and the computed state is `___All`, to set the `___Some` bit.

Selected`___`: An object is selected. FilteredPositive`___`: An object was highlighted by a filter. This usually means that not-positively-filtered objects should be hidden. RegionSelected`___`: An object is inside a region of interest on the map.

bool DIGIKAM_EXPORT Digikam::s_inlineTranslateString (
    const QString & text,
    const QString & trCode,
    QString & tr,
    QString & error )
```

Helper re-entrant static method to translate a string with online translator. Language from string is auto-detected, and target language is specified to 'trCode'. If string can be processed, translation is returned to 'tr' and function return true, else false is returned with a dysfunction description in 'error'.

NOTE: VERSION 1

These images are based on the TIFF image standard.

For these models: Kodak DSC Pro SLR/c, Kodak DSC Pro SLR/n, Kodak DSC Pro 14N, Kodak DSC PRO 14nx.

DNG is publicly available archival format for the raw files generated by digital cameras. By addressing the lack of an open standard for the raw files created by individual camera models, DNG helps ensure that photographers will be able to access their files in the future.

For DSC-F828 8 megapixel digital camera or Sony DSC-R1.

For devices based on Foveon X3 direct image sensor.

For Alpha devices.

## 5.2 Digikam::Matrix Namespace Reference

### Functions

- [MetaEngineRotation matrix](#) ([MetaEngine::ImageOrientation](#) exifOrientation)
- [MetaEngineRotation matrix](#) ([MetaEngineRotation::TransformationAction](#) action)

### 5.2.1 Detailed Description

If the picture is displayed according to the exif orientation tag, the user will request rotating operations relative to what he sees, and that is the picture rotated according to the EXIF tag. So the operation requested and the given EXIF angle must be combined. E.g. if orientation is "6" (rotate 90 clockwise to show correctly) and the user selects 180 clockwise, the operation is 270. If the user selected 270, the operation would be None (and clearing the exif tag).

This requires to describe the transformations in a model which cares for both composing ( $180+90=270$ ) and eliminating ( $180+180=no\ action$ ), as well as the non-commutative nature of the operations ( $vflip+90$  is not  $90+vflip$ )

All 2D transformations can be described by a 2x3 matrix, see [QWMetaEngineRotation](#). All transformations needed here - rotate 90, 180, 270, flipV, flipH - can be described in a 2x2 matrix with the values 0,1,-1 (because flipping is expressed by changing the sign only, and sine and cosine of 90, 180 and 270 are either 0,1 or -1).

$$x' = m11 x + m12 y \quad y' = m21 x + m22 y$$

Moreover, all combinations of these rotate/flip operations result in one of the eight matrices defined below. This did not proof that mathematically, but empirically.

## 6.2.1 Member Enumeration Documentation

### 6.2.1.1 AlbumDataRole

```
enum Digikam::AbstractAlbumModel::AlbumDataRole
```

#### Enumerator

AlbumTitleRole	Returns the album title. Principally the same as display role, but without any additions.
AlbumTypeRole	Returns the <code>Album::Type</code> of the associated album.
AlbumPointerRole	Returns a pointer to the associated <code>Album</code> object.

### 6.3.1 Detailed Description

Base class for all tree views that display Album-based content provided by an [AbstractSpecificAlbumModel](#). This class enables various utility functions like selecting albums on mouse actions or providing an infrastructure for displaying a context menu for albums.

Context menu handling is implemented as template methods with hook methods that can be implemented by subclasses to provide a custom behavior. In default mode no context menu is shown at all. It must be enabled via a call to `setEnabledContextMenu`.

### 6.3.2 Member Enumeration Documentation

#### 6.3.2.1 Flag

```
enum Digikam::AbstractAlbumTreeView::Flag
```

Enumerator

CreateDefaultModel	Create a default model. Not supported by abstract classes. Not part of default flags!
CreateDefaultFilterModel	Create a default filter model.
CreateDefaultDelegate	Create a delegate which paints according to settings. If not set, the Qt default delegate of the view is used.
ShowCountAccordingToSettings	Show the count according to the settings. If not set, call <code>setShowCount()</code> on the model yourself.
AlwaysShowInclusiveCounts	Always show the inclusive counts. Not part of default flags!

### 6.3.3 Constructor & Destructor Documentation

#### 6.3.3.1 AbstractAlbumTreeView()

```
Digikam::AbstractAlbumTreeView::AbstractAlbumTreeView (
    QWidget *const parent,
    Flags flags )
```

Constructs an album tree view. If you give 0 for model, call `setAlbumModel` afterwards. If you supply 0 for filterModel, call `setAlbumFilterModel` afterwards.

### 6.3.4 Member Function Documentation

#### 6.3.4.1 adaptColumnsToContent

```
void Digikam::AbstractAlbumTreeView::adaptColumnsToContent ( ) [slot]
```

Adapt the column sizes to the contents of the tree view.

#### 6.3.4.2 addCustomContextMenuActions()

```
void Digikam::AbstractAlbumTreeView::addCustomContextMenuActions (
    ContextMenuHelper & cmh,
    Album * album ) [protected], [virtual]
```

Hook method to add custom actions to the generated context menu.

## Parameters

<i>cmh</i>	helper object to create the context menu
<i>album</i>	tag on which the context menu will be created. May be null if it is requested on no tag entry

Reimplemented in [Digikam::TagFilterView](#), [Digikam::AlbumSelectTreeView](#), [Digikam::TagCheckView](#), [Digikam::TagFolderView](#), [Digikam::EditableSearchTreeView](#), and [Digikam::NormalSearchTreeView](#).

**6.3.4.3 contextMenuIcon()**

```
QPixmap Digikam::AbstractAlbumTreeView::contextMenuIcon ( ) const [protected], [virtual]
```

Hook method that can be implemented to return a special icon used for the context menu.

## Returns

the icon for the context menu

**6.3.4.4 contextMenuTitle()**

```
QString Digikam::AbstractAlbumTreeView::contextMenuTitle ( ) const [protected], [virtual]
```

Hook method to implement that returns the title for the context menu.

## Returns

title for the context menu

Reimplemented in [Digikam::TagFolderView](#), and [Digikam::EditableSearchTreeView](#).

**6.3.4.5 currentAlbumChanged**

```
void Digikam::AbstractAlbumTreeView::currentAlbumChanged (
    Album * currentAlbum ) [signal]
```

Emitted when the currently selected album changes

**6.3.4.6 doLoadState()**

```
void Digikam::AbstractAlbumTreeView::doLoadState ( ) [override], [virtual]
```

Implements state loading for the album tree view in a somewhat clumsy procedure because the model may not be fully loaded when this method is called. Therefore the config is first parsed into `d->statesByAlbumId` which holds the state of all tree view entries indexed by album id. Afterwards an initial sync run is done restoring the state of all model entries that are already present at this time. Every processed entry is removed from `d->statesByAlbumId`. If there are still entries left in this map we assume that the model is not fully loaded at the moment. Therefore the `rowsInserted` signal is connected to a slot that restores the state of new rows based on the remaining entries in `d->statesByAlbumId`.

Implements [Digikam::StateSavingObject](#).

Reimplemented in [Digikam::AbstractCheckableAlbumTreeView](#), and [Digikam::TagCheckView](#).

### 6.3.4.7 doSaveState()

```
void Digikam::AbstractAlbumTreeView::doSaveState ( ) [override], [virtual]
```

Implement this hook method for state saving. Use [getConfigGroup\(\)](#) and [entryName\(\)](#) for the implementation.

Implements [Digikam::StateSavingObject](#).

Reimplemented in [Digikam::AbstractCheckableAlbumTreeView](#), and [Digikam::TagCheckView](#).

### 6.3.4.8 expandEverything

```
void Digikam::AbstractAlbumTreeView::expandEverything (
    const QModelIndex & index ) [slot]
```

Expands the complete tree under the given index.

#### Parameters

<i>index</i>	the index to start expanding everything
--------------	---

### 6.3.4.9 expandMatches()

```
bool Digikam::AbstractAlbumTreeView::expandMatches (
    const QModelIndex & index )
```

Ensures that every current match is visible by expanding all parent entries.

#### Parameters

<i>index</i>	the index to start ensuring expansion state
--------------	---

#### Returns

`true` if there was a match under `index`. This return value can normally be ignored by the caller because it is only used for an internal recursion.

### 6.3.4.10 handleCustomContextMenuAction()

```
void Digikam::AbstractAlbumTreeView::handleCustomContextMenuAction (
    QAction * action,
    const AlbumPointer< Album > & album ) [protected], [virtual]
```

Hook method to handle the custom context menu actions that were added with `addCustomContextMenuActions`.

#### Parameters

<i>action</i>	the action that was chosen by the user, may be null if none of the custom actions were selected
<i>album</i>	the tag on which the context menu was requested. May be null if there was no

Reimplemented in [Digikam::TagFilterView](#), [Digikam::AlbumSelectTreeView](#), [Digikam::TagFolderView](#), [Digikam::EditableSearchTreeView](#) and [Digikam::NormalSearchTreeView](#).

#### 6.3.4.11 indexVisuallyAt()

```
QModelIndex Digikam::AbstractAlbumTreeView::indexVisuallyAt (
    const QPoint & p )
```

This is a combination of `indexAt()` checked with `visualRect()`. `p` must be in the viewport currently. Decoration will not be included. Suitable for mouse click positions.

#### 6.3.4.12 pixmapForDrag()

```
QPixmap Digikam::AbstractAlbumTreeView::pixmapForDrag (
    const QStyleOptionViewItem & option,
    QList< QModelIndex > indexes ) [protected], [virtual]
```

TODO: Move to delegate, when we have one. Copy code from image delegate for creating icons when dragging multiple items

#### 6.3.4.13 scrollToSelectedAlbum

```
void Digikam::AbstractAlbumTreeView::scrollToSelectedAlbum ( ) [slot]
```

Scrolls to the first selected album if there is one.

#### 6.3.4.14 selectedAlbumsChanged

```
void Digikam::AbstractAlbumTreeView::selectedAlbumsChanged (
    const QList< Album * > & selectedAlbums ) [signal]
```

Emitted when the current selection changes. Use `currentChanged` unless in multi-selection mode.

#### 6.3.4.15 setAlbumManagerCurrentAlbum()

```
void Digikam::AbstractAlbumTreeView::setAlbumManagerCurrentAlbum (
    const bool setCurrentAlbum )
```

Some treeviews shall control the global current album kept by [AlbumManager](#). Other treeview are self-contained and shall not change the current album. Default: false

#### 6.3.4.16 setContextMenuIcon()

```
void Digikam::AbstractAlbumTreeView::setContextMenuIcon (
    const QPixmap & pixmap )
```

Set the context menu title and icon. This is used by the default implementation of [contextMenuIcon\(\)](#) and [contextMenuTitle\(\)](#). You can alternatively reimplement these methods.

#### 6.3.4.17 setCurrentAlbums

```
void Digikam::AbstractAlbumTreeView::setCurrentAlbums (
    const QList< Album * > & albums,
    bool selectInAlbumManager = true ) [slot]
```

Selects the given album.

## Parameters

<i>albums</i>	the albums to select
<i>selectInAlbumManager</i>	the album will be set as current album, if both this parameter is true and <a href="#">setAlbumManagerCurrentAlbum()</a> was set to true.

**6.3.4.18 setEnableContextMenu()**

```
void Digikam::AbstractAlbumTreeView::setEnableContextMenu (
    const bool enable )
```

Determines the global decision to show a popup menu or not. More detailed decision at which position a menu can be shown and where not can be made by implementing `showContextMenuAt`.

## Parameters

<i>enable</i>	if true, a context menu can be shown
---------------	--------------------------------------

**6.3.4.19 setExpandNewCurrentItem()**

```
void Digikam::AbstractAlbumTreeView::setExpandNewCurrentItem (
    const bool doThat )
```

Expand an item when making it the new current item

**6.3.4.20 setExpandOnSingleClick()**

```

```
void Digikam::AbstractAlbumTreeView::setSelectOnContextMenu (
    const bool select )
```

## 6.6.1 Constructor & Destructor Documentation

### 6.6.1.1 AbstractAlbumTreeViewSelectComboBox()

```
Digikam::AbstractAlbumTreeViewSelectComboBox::AbstractAlbumTreeViewSelectComboBox (
    QWidget *const parent = nullptr) [explicit]
```

Abstract class. This is an [AlbumSelectComboBox](#) which installs an [AlbumTreeView](#), not a plain QTreeView, as view.

## 6.6.2 Member Function Documentation

### 6.6.2.1 addCheckUncheckContextMenuActions()

```
void Digikam::AbstractAlbumTreeViewSelectComboBox::addCheckUncheckContextMenuActions ( )
```

Enables a context menu which contains options to check or uncheck groups of albums, given you have a checkable model. Call this method after `setModel()`.

### 6.6.2.2 installView()

```
void Digikam::AbstractAlbumTreeViewSelectComboBox::installView (
    QAbstractItemView * view = nullptr ) [override], [protected], [virtual]
```

Replace the standard combo box list view with a `QTreeView`. Call this after installing an appropriate model.

Reimplemented from [Digikam::TreeViewComboBox](#).

### 6.6.2.3 sendViewportEventToView()

```
void Digikam::AbstractAlbumTreeViewSelectComboBox::sendViewportEventToView (
    QEvent * e ) [override], [protected], [virtual]
```

Implement in subclass: Send the given event to the `viewportEvent()` method of `m_view`. This method is protected for a usual `QAbstractItemView`. You can override, pass a view, and call parent implementation. The existing view will be used. You must then also reimplement `sendViewportEventToView`.

Implements [Digikam::StayPoppedUpComboBox](#).

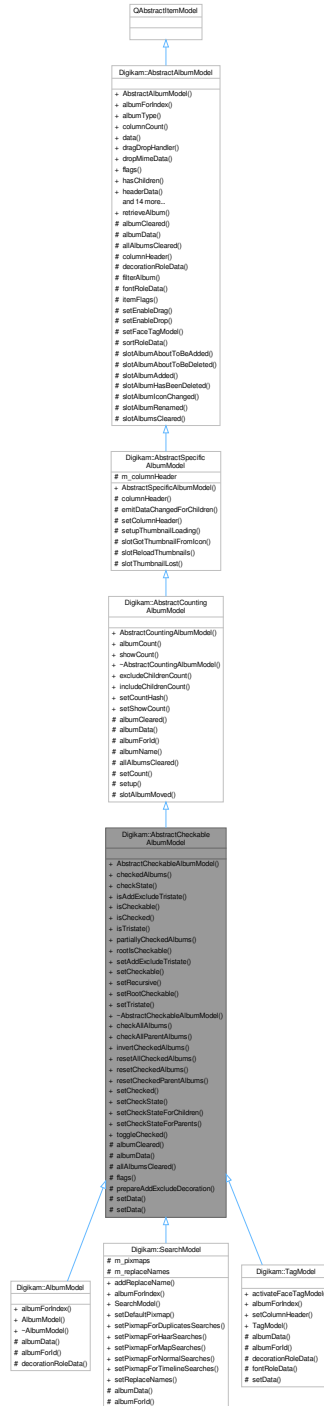

### 6.6.2.4 setTreeView()

```
void Digikam::AbstractAlbumTreeViewSelectComboBox::setTreeView (
    AbstractAlbumTreeView *const treeView )
```

Set a tree view created by you instead of creating a default view (in the subclasses). Only takes effect before calling `setModel`.

#### 6.7.2.2 albumData()

```
QVariant Digikam::AbstractCheckableAlbumModel::albumData (
    Album * a,
    int role ) const [override], [protected], [virtual]
```

#### Note

these can be reimplemented in a subclass

Reimplemented from [Digikam::AbstractAlbumModel](#).

Reimplemented in [Digikam::AlbumModel](#), [Digikam::TagModel](#), and [Digikam::SearchModel](#).

#### 6.7.2.3 allAlbumsCleared()

```
void Digikam::AbstractCheckableAlbumModel::allAlbumsCleared ( ) [override], [protected],
[virtual]
```

Reimplemented from [Digikam::AbstractAlbumModel](#).

#### 6.7.2.4 checkStateChanged

```
void Digikam::AbstractCheckableAlbumModel::checkStateChanged (
    Album * album,
    Qt::CheckState checkState ) [signal]
```

Emitted when the check state of an album changes. checkState contains the new Qt::CheckState of album

#### 6.7.2.5 prepareAddExcludeDecoration()

```
void Digikam::AbstractCheckableAlbumModel::prepareAddExcludeDecoration (
    Album * a,
    QPixmap & icon ) const [protected]
```

If in AddExcludeTristate mode, changes the icon as to indicate the state.

#### 6.7.2.6 setAddExcludeTristate()

```
void Digikam::AbstractCheckableAlbumModel::setAddExcludeTristate (
    bool b )
```

Sets a special tristate mode, which offers the three modes "unchecked", "added" and "excluded", where "excluded" corresponds to partially checked internally, but is reflected in the treeview through the decoration only.

#### 6.7.2.7 setData()

```
bool Digikam::AbstractCheckableAlbumModel::setData (
    const QModelIndex & index,
    const QVariant & value,
    int role = Qt::EditRole ) [override], [protected]
```

#### Note

Do not call this function directly, use the setData(..., bool recursive)

#### 6.7.2.8 setRecursive()

```
void Digikam::AbstractCheckableAlbumModel::setRecursive (
    bool recursive )
```

If an item gets checked, all childs get checked as well, If an item gets unchecked, all childs get unchecked as well

#### 6.7.2.9 setRootCheckable()

```
void Digikam::AbstractCheckableAlbumModel::setRootCheckable (
    bool rootIsCheckable )
```

Triggers if the root album is checkable. Only applicable if the root album is contained at all, and if isCheckable() is true.

### 6.7.2.10 setTristate()

```
void Digikam::AbstractCheckableAlbumModel::setTristate (
    bool isTristate )
```

Triggers if the albums in this model are tristate. Used to allow the user to actively set a third state, don't use if you only want to display a third state. Note that you want to set setCheckable(true) before.

## 6.8.1 Constructor & Destructor Documentation

### 6.8.1.1 AbstractCheckableAlbumTreeView()

```
Digikam::AbstractCheckableAlbumTreeView::AbstractCheckableAlbumTreeView (
    QWidget *const parent,
    Flags flags ) [explicit]
```

Models of these view *can* be checkable, they need *not*. You need to enable it on the model.

## 6.8.2 Member Function Documentation

### 6.8.2.1 albumModel()

```
AbstractCheckableAlbumModel * Digikam::AbstractCheckableAlbumTreeView::albumModel ( ) const
```

Manage check state through the model directly.

### 6.8.2.2 doLoadState()

```
void Digikam::AbstractCheckableAlbumTreeView::doLoadState ( ) [override], [virtual]
```

Implements state loading for the album tree view in a somewhat clumsy procedure because the model may not be fully loaded when this method is called. Therefore the config is first parsed into `d->statesByAlbumId` which holds the state of all tree view entries indexed by album id. Afterwards an initial sync run is done restoring the state of all model entries that are already present at this time. Every processed entry is removed from `d->statesByAlbumId`. If there are still entries left in this map we assume that the model is not fully loaded at the moment. Therefore the `rowsInserted` signal is connected to a slot that restores the state of new rows based on the remaining entries in `d->statesByAlbumId`.

Reimplemented from [Digikam::AbstractAlbumTreeView](#).

Reimplemented in [Digikam::TagCheckView](#).

### 6.8.2.3 doSaveState()

```
void Digikam::AbstractCheckableAlbumTreeView::doSaveState ( ) [override], [virtual]
```

Implement this hook method for state saving. Use [getConfigGroup\(\)](#) and [entryName\(\)](#) for the implementation.

Reimplemented from [Digikam::AbstractAlbumTreeView](#).

Reimplemented in [Digikam::TagCheckView](#).

### 6.8.2.4 isRestoreCheckState()

```
bool Digikam::AbstractCheckableAlbumTreeView::isRestoreCheckState ( ) const
```

Tells if the check state is restored while loading / saving state.

#### Returns

true if restoring check state is active

### 6.8.2.5 middleButtonPressed()

```
void Digikam::AbstractCheckableAlbumTreeView::middleButtonPressed (
    Album * a ) [override], [protected], [virtual]
```

Reimplemented from [Digikam::AbstractAlbumTreeView](#).

### 6.8.2.6 setCheckOnMiddleClick()

```
void Digikam::AbstractCheckableAlbumTreeView::setCheckOnMiddleClick (
    bool doThat )
```

Enable checking on middle mouse button click (default: on).

### 6.8.2.7 setRestoreCheckState()

```
void Digikam::AbstractCheckableAlbumTreeView::setRestoreCheckState (
    bool restore )
```

Set whether to restore check state or not.

#### Parameters

<i>restore</i>	if true, restore check state
----------------	------------------------------

### 6.9.1.6 allAlbumsCleared()

```
void Digikam::AbstractCountingAlbumModel::allAlbumsCleared ( ) [override], [protected], [virtual]
```

Reimplemented from [Digikam::AbstractAlbumModel](#).

### 6.9.1.7 excludeChildrenCount

```
void Digikam::AbstractCountingAlbumModel::excludeChildrenCount (
    const QModelIndex & index ) [slot]
```

Displays only the count of the album, without adding child albums' counts. This is the default. Can connect to QTreeView's expanded() signal.

### 6.9.1.8 includeChildrenCount

```
void Digikam::AbstractCountingAlbumModel::includeChildrenCount (
    const QModelIndex & index ) [slot]
```

Displays sum of the count of the album and child albums' counts. Can connect to QTreeView's collapsed() signal.

### 6.9.1.9 setCountHash

```
void Digikam::AbstractCountingAlbumModel::setCountHash (
    const QHash< int, int > & idCountHash ) [slot]
```

Enable displaying the count. Set a map of album id -> count (excluding children). If an album is not contained, no count is displayed. To display a count of 0, there must be an entry album id -> 0.

### 6.9.1.10 setup()

```
void Digikam::AbstractCountingAlbumModel::setup ( ) [protected]
```

Call this method in children class constructors to init signal/slots connections.

## 6.12.1 Member Function Documentation

### 6.12.1.1 `accepts()`

```
Qt::DropAction Digikam::AbstractItemDragDropHandler::accepts (
    const QDropEvent * e,
    const QModelIndex & dropIndex ) [virtual]
```

Returns if the given mime data is accepted for drop on dropIndex. Returns the proposed action, or `Qt::IgnoreAction` if not accepted.

Reimplemented in [Digikam::ImportDragDropHandler](#), [Digikam::ItemDragDropHandler](#), and [ShowFoto::ShowfotoDragDropHandler](#).

### 6.12.1.2 `acceptsMimeData()`

```
bool Digikam::AbstractItemDragDropHandler::acceptsMimeData (
    const QMimeData * data ) [virtual]
```

Returns if the given mime data can be handled. `acceptsMimeData` shall return true if a drop of the given mime data will be accepted on any index or place at all. If this returns false, the more specific method [accepts\(\)](#) will not be called for this drag. The default implementation uses [mimeTypes\(\)](#) to check for supported mime types. There is usually no need to reimplement this.

### 6.12.1.3 `createMimeData()`

```
QMimeData * Digikam::AbstractItemDragDropHandler::createMimeData (
    const QList< QModelIndex > & ) [virtual]
```

Create a mime data object for starting a drag from the given Albums

Reimplemented in [Digikam::ImportDragDropHandler](#), [Digikam::ItemDragDropHandler](#), and [ShowFoto::ShowfotoDragDropHandler](#).

### 6.12.1.4 `dropEvent()`

```
bool Digikam::AbstractItemDragDropHandler::dropEvent (
    QAbstractItemView * view,
    const QDropEvent * e,
    const QModelIndex & droppedOn ) [virtual]
```

Gives the view and the occurring drop event. The index is the index where the drop was dropped on. It may be invalid (dropped on decoration, viewport) Returns true if the event is to be accepted.

Reimplemented in [Digikam::ImportDragDropHandler](#), [Digikam::ItemDragDropHandler](#), and [ShowFoto::ShowfotoDragDropHandler](#).

### 6.12.1.5 mimeTypees()

```
QStringList Digikam::AbstractItemDragDropHandler::mimeTypees ( ) const [virtual]
```

Returns the supported mime types. Called by the default implementation of model's [mimeTypees\(\)](#).

Reimplemented in [Digikam::ImportDragDropHandler](#), [Digikam::ItemDragDropHandler](#), and [ShowFoto::ShowfotoDragDropHandler](#).

## 6.19.1 Constructor & Destructor Documentation

### 6.19.1.1 AbstractWidgetDelegateOverlay()

```
Digikam::AbstractWidgetDelegateOverlay::AbstractWidgetDelegateOverlay (
    QObject *const parent ) [explicit]
```

This class provides functionality for using a widget in an overlay. You must reimplement at least `createWidget` to return your widget. Per default it will be shown when the cursor enters an index and hidden when left. Reimplement `slotEntered()` and `mouseMove()` for more fine grained control.

## 6.19.2 Member Function Documentation

### 6.19.2.1 checkIndex()

```
bool Digikam::AbstractWidgetDelegateOverlay::checkIndex (
    const QModelIndex & index ) const [protected], [virtual]
```

Return true here if you want to show the overlay for the given index. The default implementation returns true.

Reimplemented in [Digikam::AssignNameOverlay](#), [Digikam::FaceRejectionOverlay](#), [Digikam::GroupIndicatorOverlay](#), [Digikam::ItemCoordinatesOverlay](#), [Digikam::ItemFullScreenOverlay](#), [Digikam::ItemRotateOverlay](#), [Digikam::ShowHideVersionsOverlay](#), [Digikam::ActionVersionsOverlay](#), [ShowFoto::ShowfotoCoordinatesOverlay](#), [Digikam::ImportCoordinatesOverlay](#), [Digikam::ImportLockOverlay](#), [Digikam::ImportDownloadOverlay](#), and [Digikam::ImportRotateOverlay](#).

### 6.19.2.2 checkIndexOnEnter()

```
bool Digikam::AbstractWidgetDelegateOverlay::checkIndexOnEnter (
    const QModelIndex & index ) const [protected]
```

Utility method called from `slotEntered`

### 6.19.2.3 createWidget()

```
virtual QWidget * Digikam::AbstractWidgetDelegateOverlay::createWidget ( ) [protected], [pure
virtual]
```

Create your widget here. When creating the object, pass `parentWidget()` as parent widget. Ownership of the object is passed. It will be deleted in `setActive(false)`.

Implemented in [Digikam::AssignNameOverlay](#), [Digikam::GroupIndicatorOverlay](#), [Digikam::ItemCoordinatesOverlay](#), [Digikam::ItemRatingOverlay](#), [Digikam::TagsLineEditOverlay](#), [Digikam::HoverButtonDelegateOverlay](#), [ShowFoto::ShowfotoCoordinatesOverlay](#), [Digikam::ImportCoordinatesOverlay](#), [Digikam::ImportLockOverlay](#), [Digikam::ImportDownloadOverlay](#), and [Digikam::ImportRatingOverlay](#).

### 6.19.2.4 hide()

```
void Digikam::AbstractWidgetDelegateOverlay::hide ( ) [protected], [virtual]
```

Called when the widget shall be hidden (mouse cursor left index, viewport, uninstalled etc.). Default implementation `hide()`s `m_widget`.

Reimplemented in [Digikam::ItemRatingOverlay](#), [Digikam::TagsLineEditOverlay](#), [Digikam::PersistentWidgetDelegateOverlay](#), and [Digikam::ImportRatingOverlay](#).

### 6.19.2.5 parentWidget()

```
QWidget * Digikam::AbstractWidgetDelegateOverlay::parentWidget ( ) const [protected]
```

Returns the widget to be used as parent for your widget created in [createWidget\(\)](#)

### 6.19.2.6 setActive()

```
void Digikam::AbstractWidgetDelegateOverlay::setActive (
    bool active ) [override], [virtual]
```

If active is true, this will call [createWidget\(\)](#), initialize the widget for use, and setup connections for the virtual slots. If active is false, this will delete the widget and disconnect all signal from model and view to this object (!)

Reimplemented from [Digikam::ItemDelegateOverlay](#).

Reimplemented in [Digikam::FaceRejectionOverlay](#), [Digikam::ItemCoordinatesOverlay](#), [Digikam::ItemFullScreenOverlay](#), [Digikam::ItemRotateOverlay](#), [Digikam::ItemSelectionOverlay](#), [Digikam::ShowHideVersionsOverlay](#), [Digikam::ActionVersionsOverlay](#), [Digikam::HoverButtonDelegateOverlay](#), [Digikam::PersistentWidgetDelegateOverlay](#), [ShowFoto::ShowfotoCoordinatesOverlay](#), [Digikam::ImportCoordinatesOverlay](#), [Digikam::ImportLockOverlay](#), [Digikam::ImportDownloadOverlay](#), [Digikam::ImportRotateOverlay](#), [Digikam::AssignNameOverlay](#), [Digikam::GroupIndicatorOverlay](#), [Digikam::ItemRatingOverlay](#), [Digikam::TagsLineEditOverlay](#), and [Digikam::ImportRatingOverlay](#).

### 6.19.2.7 slotEntered

```
void Digikam::AbstractWidgetDelegateOverlay::slotEntered (
    const QModelIndex & index ) [protected], [virtual], [slot]
```

Default implementation shows the widget iff the index is valid and checkIndex returns true.

Reimplemented in [Digikam::GroupIndicatorOverlay](#), [Digikam::ItemCoordinatesOverlay](#), [Digikam::ItemRatingOverlay](#), [Digikam::TagsLineEditOverlay](#), [Digikam::PersistentWidgetDelegateOverlay](#), [ShowFoto::ShowfotoCoordinatesOverlay](#), [Digikam::ImportCoordinatesOverlay](#), [Digikam::ImportLockOverlay](#), [Digikam::ImportDownloadOverlay](#), and [Digikam::ImportRatingOverlay](#).

### 6.19.2.8 slotReset

```
void Digikam::AbstractWidgetDelegateOverlay::slotReset ( ) [protected], [virtual], [slot]
```

Default implementations of these three slots call [hide\(\)](#)

Reimplemented in [Digikam::PersistentWidgetDelegateOverlay](#).

### 6.19.2.9 viewportLeaveEvent()

```
void Digikam::AbstractWidgetDelegateOverlay::viewportLeaveEvent (
    QObject * obj,
    QEvent * event ) [protected], [virtual]
```

Called when a `QEvent::Leave` of the viewport is received. The default implementation [hide\(\)](#)s.

Reimplemented in [Digikam::AssignNameOverlay](#), and [Digikam::PersistentWidgetDelegateOverlay](#).

### 6.19.2.10 widgetEnterEvent()

```
void Digikam::AbstractWidgetDelegateOverlay::widgetEnterEvent ( ) [protected], [virtual]
```

Called when a QEvent::Enter resp. QEvent::Leave event for the widget is received. The default implementation does nothing.

Reimplemented in [Digikam::AssignNameOverlay](#), [Digikam::FaceRejectionOverlay](#), [Digikam::ItemFullScreenOverlay](#), [Digikam::ItemRatingOverlay](#), [Digikam::ItemRotateOverlay](#), [Digikam::ImportRatingOverlay](#), and [Digikam::ImportRotateOverlay](#).

### 6.19.2.11 widgetEnterNotifyMultiple()

```
void Digikam::AbstractWidgetDelegateOverlay::widgetEnterNotifyMultiple (
    const QModelIndex & index ) [protected]
```

A sample implementation for above methods

## 6.22.1 Member Enumeration Documentation

### 6.22.1.1 MenuCategoryFlag

```
enum Digikam::ActionItemModel::MenuCategoryFlag
```

## Enumerator

ToplevelMenuCategory	The toplevel menu's text is used as category.
ParentMenuCategory	If the action is in a submenu, this menu's text is taken as category.
SortCategoriesAlphabetically	Sort categories alphabetically by category name.
SortCategoriesByInsertionOrder	Sort categories by the order they are added (found in the scanned menu)

## 6.22.2 Constructor & Destructor Documentation

### 6.22.2.1 ActionItemModel()

```
Digikam::ActionItemModel::ActionItemModel (
    QObject *const parent = nullptr ) [explicit]
```

This class is a [CategorizedItemModel](#) based on QActions, taking an action's text and icon for display and decoration. It is possible to retrieve an action for an index, and to call the action's slots from a given index.

## 6.22.3 Member Function Documentation

### 6.22.3.1 actionForIndex()

```
QAction * Digikam::ActionItemModel::actionForIndex (
    const QModelIndex & index ) [static]
```

Returns the action for the given index. The method can also be used for indices from proxy models.

### 6.22.3.2 createFilterModel()

```
DCategorizedSortFilterProxyModel * Digikam::ActionItemModel::createFilterModel ( ) [override],
[virtual]
```

Reimplemented from [Digikam::CategorizedItemModel](#).

### 6.22.3.3 hover

```
void Digikam::ActionItemModel::hover (
    const QModelIndex & index ) [slot]
```

These three slots will cause the slots of the referred action to be called. Connect here for example a view's signals. Note that you can also pass indices from proxy models.

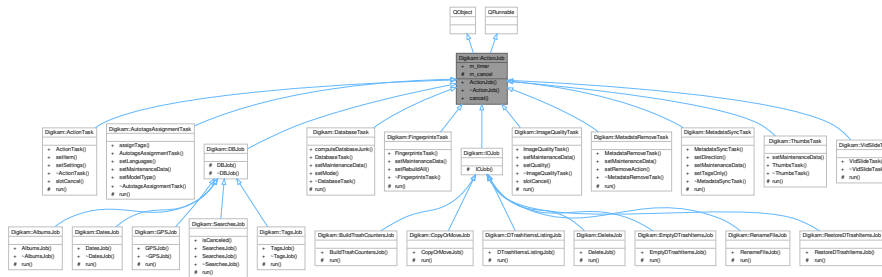

### 6.22.3.4 itemForAction()

```
QStandardItem * Digikam::ActionItemModel::itemForAction (
    QAction * action ) const
```

Returns the action for the given index. Note: these methods perform O(n).

## 6.32.1 Member Function Documentation

### 6.32.1.1 setAlbumModels()

```
void Digikam::AddTagsLineEdit::setAlbumModels (
    TagModel *const model,
    TagPropertiesFilterModel *const filteredModel,
    AlbumFilterModel *const filterModel )
```

Convenience: Will call [setSupportingTagModel\(\)](#) and [setFilterModel\(\)](#)

### 6.32.1.2 setCurrentTag()

```
void Digikam::AddTagsLineEdit::setCurrentTag (
    TAlbum *const tag )
```

Adjusts the current default tagging action to assign the given tag

### 6.32.1.3 setFilterModel()

```
void Digikam::AddTagsLineEdit::setFilterModel (
    AlbumFilterModel *const model )
```

Set a tag filter model. Completion suggestions will be limited to tags contained in the filter model.

#### 6.32.1.4 setParentTag

```
void Digikam::AddTagsLineEdit::setParentTag (
    Album *const album ) [slot]
```

Set a parent tag for suggesting a parent tag for a new tag, and a default action. If you set a tag tree view, this is taken care for automatically.

#### 6.32.1.5 setSupportingTagModel()

```
void Digikam::AddTagsLineEdit::setSupportingTagModel (
    TagModel *const model )
```

Optional: set a model for additional information, like tag icons

#### 6.32.1.6 setTagTreeView()

```
void Digikam::AddTagsLineEdit::setTagTreeView (
    TagTreeView *const treeView )
```

Reads a tag treeview and takes the currently selected tag into account when suggesting a parent tag for a new tag, and a default action.

#### 6.32.1.7 slotReturnPressed

```
void Digikam::AddTagsLineEdit::slotReturnPressed ( ) [protected], [slot]
```

Tagging action is used by facemanagement and assignwidget

#### 6.32.1.8 taggingActionActivated

```
void Digikam::AddTagsLineEdit::taggingActionActivated (
    const TaggingAction & action ) [signal]
```

Emitted when the user activates an action (typically, by pressing return)

#### 6.32.1.9 taggingActionSelected

```
void Digikam::AddTagsLineEdit::taggingActionSelected (
    const TaggingAction & action ) [signal]
```

Emitted when an action is selected. This already happens if anything is typed.

**6.44.4.23 setExtraData()**

```
void Digikam::Album::setExtraData (
    const void *const key,
    void *const value )
```

This allows to associate some "extra" data to a [Album](#). As one [Album](#) can be used by several objects (often views) which all need to add some data, you have to use a key to reference your extra data within the [Album](#).

That way a [Album](#) can hold and provide access to all those views separately.

for eg,

```
album->setExtraData( this, searchFolderItem );
```

and can later access the searchFolderItem by doing

```
SearchFolderItem *item = static_cast<SearchFolderItem*>(album->extraData(this));
```

Note: you have to remove and destroy the data you associated yourself when you don't need it anymore!

**Parameters**

<i>key</i>	the key of the extra data
<i>value</i>	the value of the extra data

**See also**

[extraData](#)

[removeExtraData](#)

**6.44.4.24 setUsedByLabelsTree()**

**Parameters**

<i>isUsed</i>	=> the status of the usage
---------------	----------------------------

**6.44.4.25 title()**

```
QString Digikam::Album::title ( ) const
```

**Returns**

the `title` aka name of the album

#### 6.44.4.26 type()

`Album::Type Digikam::Album::type ( ) const`

##### Returns

the type of album

## 6.49.1 Member Enumeration Documentation

### 6.49.1.1 FilterBehavior

```
enum Digikam::AlbumFilterModel::FilterBehavior
```

#### Enumerator

SimpleFiltering	If an index does not match, the index and all its children are filtered out. This is the Qt default behavior, but undesirable for album trees.
FullFiltering	Default behavior. If an index matches, it is shown, which directly means all its parents are shown as well. In addition, all its children are shown as well.
StrictFiltering	If an index matches, it is shown, which directly means all its parents are shown as well. Its children are not shown unless they also match.

### 6.49.1.2 MatchResult

```
enum Digikam::AlbumFilterModel::MatchResult
```

#### Enumerator

NoMatch	This enum can be used as a boolean value if match/no match only is needed.
DirectMatch	The index itself is matched.
ParentMatch	A parent if the index is matched.
ChildMatch	A child of the index is matched.
SpecialMatch	The index is matched not because of search settings, but because it has a special type.

## 6.49.2 Member Function Documentation

### 6.49.2.1 compareByOrder()

```
static int Digikam::AlbumFilterModel::compareByOrder (
    int compareResult,
    Qt::SortOrder sortOrder ) [inline], [static]
```

Takes a typical result from a compare method (0 is equal, -1 is less than, 1 is greater than) and applies the given sort order to it.

### 6.49.2.2 compareValue()

```
template<typename T >
static int Digikam::AlbumFilterModel::compareValue (
    const T & a,
    const T & b ) [inline], [static]
```

Returns the usual compare result of -1, 0, or 1 for lessThan, equals and greaterThan.

### 6.49.2.3 hasSearchResult

```
void Digikam::AlbumFilterModel::hasSearchResult (
    bool hasResult ) [signal]
```

Indicates whether the newly applied filter results in a search result or not.

#### Parameters

<i>hasResult</i>	true if the new filter matches any album, else false
------------------	--

### 6.49.2.4 isFiltering()

```
bool Digikam::AlbumFilterModel::isFiltering ( ) const [virtual]
```

Returns if the currently applied filters will result in any filtering.

#### Returns

true if the current selected filter could result in any filtering without checking if this really happens.

Reimplemented in [Digikam::CheckableAlbumFilterModel](#), [Digikam::SearchFilterModel](#), and [Digikam::TagPropertiesFilterModel](#).

### 6.49.2.5 lessThan()

```
bool Digikam::AlbumFilterModel::lessThan (
    const QModelIndex & left,
    const QModelIndex & right ) const [override], [protected]
```

Implementation to sort Tags that contain Unconfirmed Faces, according to the Unconfirmed Face Count.

### 6.49.2.6 matches()

```
bool Digikam::AlbumFilterModel::matches (
    Album * album ) const [protected], [virtual]
```

This method provides the basic match checking algorithm. Return true if this single album matches the current criteria. This method can be overridden to provide custom filtering.

## Parameters

<i>album</i>	the album to tell if it matches the filter criteria or not.
--------------	---

Reimplemented in [Digikam::CheckableAlbumFilterModel](#), [Digikam::SearchFilterModel](#), [Digikam::TagPropertiesFilterModel](#), and [Digikam::TagsManagerFilterModel](#).

**6.49.2.7 matchResult()** [1/2]

```
AlbumFilterModel::MatchResult Digikam::AlbumFilterModel::matchResult (
    Album * album ) const [protected]
```

Returns if the filter matches this album (same logic as `filterAcceptsRow`). An album matches if the search text settings are found in a parent album's title, in the album's title or in a child album's title, or if it is a special album (root) that is never filtered out.

**6.49.2.8 matchResult()** [2/2]

```
AlbumFilterModel::MatchResult Digikam::AlbumFilterModel::matchResult (
    const QModelIndex & index ) const
```

Returns the `MatchResult` of an index of this model. Never returns `NoMatch` for a valid index, because in this case, the index would rather be filtered out.

**6.49.2.9 searchTextSettings()**

```
SearchTextSettings Digikam::AlbumFilterModel::searchTextSettings ( ) const
```

Returns the settings currently used for filtering.

## Returns

current settings for filtering.

**6.49.2.10 searchTextSettingsAboutToChange**

```
void Digikam::AlbumFilterModel::searchTextSettingsAboutToChange (
    bool searched,
    bool willSearch ) [signal]
```

This signal indicates that a new [SearchTextSettings](#) arrived and is about to be applied to the model.

## Parameters

<i>searched</i>	true if filtering by text was enabled before applying the new settings
<i>willSearch</i>	true if the new settings can result in any filtering by text, else false.

**6.49.2.11 searchTextSettingsChanged**

```
void Digikam::AlbumFilterModel::searchTextSettingsChanged (
    bool wasSearching,
    bool searched ) [signal]
```

Indicates that new search text settings were applied.

**Parameters**

<i>wasSearching</i>	true if this is not a new search that
<i>searched</i>	true if the new settings result in any filtering

**6.49.2.12 setFilterBehavior()**

```
void Digikam::AlbumFilterModel::setFilterBehavior (
    FilterBehavior behavior )
```

Sets the filter behavior. Default is FullFiltering.

**6.49.2.13 setSearchTextSettings**

```
void Digikam::AlbumFilterModel::setSearchTextSettings (
    const SearchTextSettings & settings ) [slot]
```

Accepts new settings used for filtering and applies them to the model.

**Parameters**

<i>settings</i>	new settings to apply. An empty text will be interpreted as no filtering
-----------------	--

**6.49.2.14 setSourceAlbumModel()**

```
void Digikam::AlbumFilterModel::setSourceAlbumModel (
    AbstractAlbumModel *const source )
```

Sets the source model. Note: If a chained filter model is set, it will not be reset, but the source album model will be made source of the chained filter model.

**6.49.2.15 setSourceFilterModel()**

```
void Digikam::AlbumFilterModel::setSourceFilterModel (
    AlbumFilterModel *const source )
```

Sets a chained filter model. Note: If a direct source album model is set as current source, it will be set as source AlbumModel of the new source filter model.

### 6.49.2.16 setSourceModel()

```
void Digikam::AlbumFilterModel::setSourceModel (
    QAbstractItemModel *const model ) [override], [protected]
```

Use setSourceAlbumModel.

See also

[setSourceAlbumModel](#)

Parameters

<i>model</i>	source model
--------------	--------------

### 6.49.2.17 signalFilterChanged

```
void Digikam::AlbumFilterModel::signalFilterChanged ( ) [signal]
```

Indicates that a new filter was applied to the model.

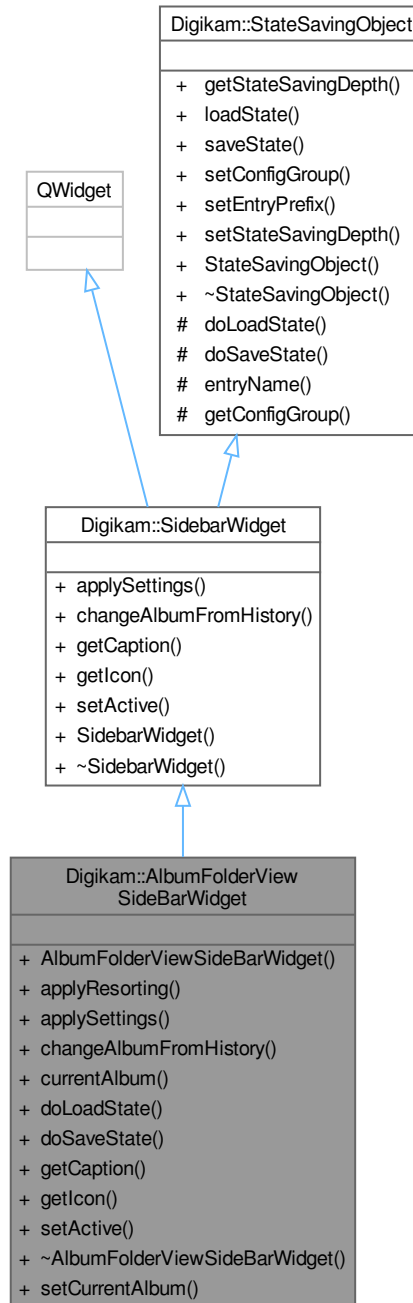

### 6.49.2.18 updateFilter()

```
void Digikam::AlbumFilterModel::updateFilter ( )
```

Force invalidateFilter() externally.

## 6.55.1 Detailed Description

[AlbumManager](#) manages albums: does listing of albums and controls the lifetime of it. For [PAlbums](#) and [TAlbums](#), the listing is done by reading the db directly and building the hierarchy of the albums. For [DAlbums](#), since the listing takes time, the work is delegated to a dbjob. Interested frontend entities can connect to the albummanager to receive notifications of new Albums, when Albums are deleted and when the current album is changed.

Additional operations are provided for: creating/deleting/rename Albums, updating icons and moving Albums.

- `AbstractAlbumModel` \* **model** () const

### Protected Attributes

- `AbstractAlbumModel` \* **m\_model** = nullptr

## 6.59.1 Member Function Documentation

### 6.59.1.1 accepts()

```
Qt::DropAction Digikam::AlbumModelDragDropHandler::accepts (
    const QDropEvent * e,
    const QModelIndex & dropIndex ) [virtual]
```

Returns if the given mime data is accepted for drop on dropIndex. Returns the proposed action, or Qt::IgnoreAction if not accepted.

Reimplemented in [Digikam::AlbumDragDropHandler](#), and [Digikam::TagDragDropHandler](#).

### 6.59.1.2 acceptsMimeData()

```
bool Digikam::AlbumModelDragDropHandler::acceptsMimeData (
    const QMimeData * data ) [virtual]
```

Returns if the given mime data can be handled. `acceptsMimeData` shall return true if a drop of the given mime data will be accepted on any index or place at all. If this returns false, the more specific method [accepts\(\)](#) will not be called for this drag. The default implementation uses [mimeTypes\(\)](#) to check for supported mime types. There is usually no need to reimplement this.

### 6.59.1.3 createMimeData()

```
QMimeData * Digikam::AlbumModelDragDropHandler::createMimeData (
    const QList< Album * > & ) [virtual]
```

Create a mime data object for starting a drag from the given Albums

Reimplemented in [Digikam::AlbumDragDropHandler](#), and [Digikam::TagDragDropHandler](#).

### 6.59.1.4 dropEvent()

```
bool Digikam::AlbumModelDragDropHandler::dropEvent (
    QAbstractItemView * view,
    const QDropEvent * e,
    const QModelIndex & droppedOn ) [virtual]
```

Gives the view and the occurring drop event. The index is the index where the drop was dropped on. It may be invalid (dropped on decoration, viewport) Returns true if the event is to be accepted.

Reimplemented in [Digikam::AlbumDragDropHandler](#), and [Digikam::TagDragDropHandler](#).

### 6.59.1.5 mimeTypes()

```
QStringList Digikam::AlbumModelDragDropHandler::mimeTypes ( ) const [virtual]
```

Returns the supported mime types. Called by the default implementation of model's [mimeTypes\(\)](#).

Reimplemented in [Digikam::AlbumDragDropHandler](#), and [Digikam::TagDragDropHandler](#).

### 6.60.2 Constructor & Destructor Documentation

#### 6.60.2.1 AlbumModificationHelper()

```
Digikam::AlbumModificationHelper::AlbumModificationHelper (
    QObject *const parent,
    QWidget *const dialogParent ) [explicit]
```

Constructor.

#### Parameters

<i>dialogParent</i>	parent widget for dialogs displayed by this object

#### 6.60.2.2 ~AlbumModificationHelper()

```
Digikam::AlbumModificationHelper::~~AlbumModificationHelper ( ) [override]

### 6.60.3 Member Function Documentation

#### 6.60.3.1 bindAlbum()

```
void Digikam::AlbumModificationHelper::bindAlbum (
    QAction *const action,
    PAlbum *const parent ) const
```

Sets the album that the given action operates on. You must call `bindTag` and then connect the action's triggered to the desired slot, `slotTagNew()`, `slotTagEdit()` or `slotTagDelete()`. Note: Changes the Action's user data.

### 6.60.3.2 boundAlbum()

```
PAlbum * Digikam::AlbumModificationHelper::boundAlbum (
    QObject *const action ) const
```

Returns the album bound with bindAlbum. The given QObject shall be a QAction, but for convenience the given object will be checked with qobject\_cast first, so you can pass QObject::sender().

### 6.60.3.3 slotAlbumDelete

```
void Digikam::AlbumModificationHelper::slotAlbumDelete (
    PAlbum * album ) [slot]
```

Deletes the given album after waiting for a graphical confirmation of the user.

#### Parameters

<i>album</i>	the album to delete
--------------	---------------------

### 6.60.3.4 slotAlbumEdit

```
void Digikam::AlbumModificationHelper::slotAlbumEdit (
    PAlbum * album ) [slot]
```

Graphically edits the properties of the given album.

#### Parameters

<i>album</i>	the album to edit
--------------	-------------------

### 6.60.3.5 slotAlbumNew

```
PAlbum * Digikam::AlbumModificationHelper::slotAlbumNew (
    PAlbum * parentAlbum ) [slot]
```

Creates a new album under the given parent. The user will be prompted for the settings of the new album.

#### Parameters

<i>parentAlbum</i>	parent album for the new one
--------------------	------------------------------

#### Returns

the new album or 0 if no album was created

### 6.60.3.6 slotAlbumRename

```
void Digikam::AlbumModificationHelper::slotAlbumRename (  
    PAlbum * album ) [slot]
```

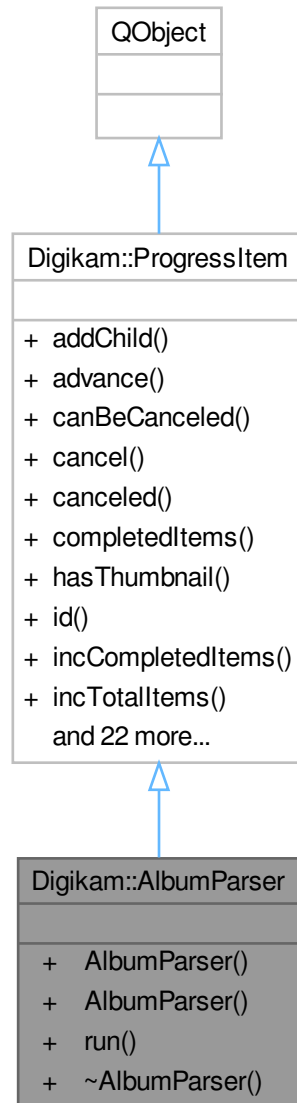

Renames the given album. The user will be prompted for a new name.

#### Parameters

<i>album</i>	the album to rename
--------------	---------------------

## 6.61 Digikam::AlbumParser Class Reference

Inheritance diagram for Digikam::AlbumParser:

### Signals

- void **signalComplete** (const QList< QUrl > &)

### Signals inherited from [Digikam::ProgressItem](#)

- void [progressItemAdded](#) ([ProgressItem](#) \*item)

- Emitted when a new [ProgressItem](#) is added.*

  - void [progressItemCanceled](#) ([ProgressItem](#) \*item)

*Emitted when an item was canceled. It will not go away immediately, only when the owner sets it complete, which will usually happen. Can be used to visually indicate the canceled status of an item. Should be used by the owner of the item to make sure it is set completed even if it is canceled. There is a [ProgressManager::slotStandardCancelHandler](#) which simply sets the item completed and can be used if no other work needs to be done on cancel.*
- void **progressItemCanceledById** (const QString &id)
- void [progressItemCompleted](#) ([ProgressItem](#) \*item)
- Emitted when a progress item was completed. The item will be deleted afterwards, so slots connected to this are the last chance to work with this item.*
- void [progressItemLabel](#) ([ProgressItem](#) \*item, const QString &label)
- Emitted when the label of an item changed. Should be used by progress dialogs to update the label of an item.*
- void [progressItemProgress](#) ([ProgressItem](#) \*item, unsigned int v)
- Emitted when the progress value of an item changes.*
- void [progressItemStatus](#) ([ProgressItem](#) \*item, const QString &mess)
- Emitted when the status message of an item changed. Should be used by progress dialogs to update the status message for an item.*
- void [progressItemThumbnail](#) ([ProgressItem](#) \*item, const QPixmap &thumb)
- Emitted when the thumbnail data must be set in item.*
- void [progressItemUsesBusyIndicator](#) ([ProgressItem](#) \*item, bool value)
- Emitted when the busy indicator state of an item changes. Should be used by progress dialogs so that they can adjust the display of the progress bar to the new mode.*

## Public Member Functions

## Public Member Functions inherited from [Digikam::ProgressItem](#)

- unsigned int **completedItems** () const
- bool [hasThumbnail](#) () const

- void **removeChild** ([ProgressItem](#) \*const kiddo)
- void **reset** ()
- Reset the progress value of this item to 0 and the status string to the empty string.*
- void **setComplete** ()

Tell the item it has finished. This will emit `progressItemCompleted()` result in the destruction of the item after all slots connected to this signal have executed. This is the only way to get rid of an item and needs to be called even if the item is canceled. Don't use the item after this has been called on it.

- bool **setCompletedItems** (unsigned int v)
- void **setLabel** (const QString &v)
- void **setProgress** (unsigned int v)
  - Set the progress (percentage of completion) value of this item.*
- void **setShowAtStart** (bool showAtStart)
  - Set the property to pop-up item when it's added in progress manager. Use this method if you consider that item is important to be notified to end-user.*
- void **setStatus** (const QString &v)
  - Set the string to be used for showing this item's current status.*
- void **setThumbnail** (const QIcon &icon)
  - Sets whether this item has a thumbnail.*
- void **setTotalItems** (unsigned int v)
- void **setUsesBusyIndicator** (bool useBusyIndicator)
  - Sets whether this item uses a busy indicator instead of real progress for its progress bar. If it uses a busy indicator, you are still responsible for calling `setProgress()` from time to time to update the busy indicator.*
- bool **showAtStart** () const
- const QString & **status** () const
- bool **totalCompleted** () const
- unsigned int **totalItems** () const
- void **updateProgress** ()
  - Recalculate progress according to total/completed items and update.*

## 6.70.1 Member Function Documentation

### 6.70.1.1 [filterModel\(\)](#)

```
QSortFilterProxyModel * Digikam::AlbumSelectComboBox::filterModel ( ) const
```

Return the filter model in use.

### 6.70.1.2 [installView\(\)](#)

```
void Digikam::AlbumSelectComboBox::installView (
    QAbstractItemView * view = nullptr ) [override], [protected], [virtual]
```

Replace the standard combo box list view with a QTreeView. Call this after installing an appropriate model.

Reimplemented from [Digikam::TreeViewComboBox](#).

### 6.70.1.3 model()

```
AbstractCheckableAlbumModel * Digikam::AlbumSelectComboBox::model ( ) const
```

Returns the source model. Retrieve selection information from here.

### 6.70.1.4 setAllSelectedText()

```
void Digikam::AlbumSelectComboBox::setAllSelectedText (
    bool all )
```

Enable or disable the text used to describe the status when all album is selected.

### 6.70.1.5 setCheckable()

```
void Digikam::AlbumSelectComboBox::setCheckable (
    bool checkable )
```

Enable checkboxes next to the items. Default: true

### 6.70.1.6 setCloseOnActivate()

```
void Digikam::AlbumSelectComboBox::setCloseOnActivate (
    bool close )
```

Enable closing when an item was activated (clicked). Default: false.

### 6.70.1.7 setDefaultAlbumModel()

```
void Digikam::AlbumSelectComboBox::setDefaultAlbumModel ( )
```

Once after creation, call one of these three methods. Use the first one if you want a standard combo box for PAlbums and the second one for tags, while the third allows you to provide custom source and filter models. The first two also set a default noSelectionText. Customize afterwards if required.

### 6.70.1.8 setNoSelectionText()

```
void Digikam::AlbumSelectComboBox::setNoSelectionText (
    const QString & text )
```

Sets the text that is used to describe the state when no album is selected. This may be something like "Any album" or "No tag selected". Depends on the default line edit implementation of [TreeViewLineEditComboBox](#).

### 6.70.1.9 setRecursive()

```
void Digikam::AlbumSelectComboBox::setRecursive (
    bool recursive )
```

If all subalbums shall be selected when parent will be selected

### 6.70.1.10 setShowCheckStateSummary()

```
void Digikam::AlbumSelectComboBox::setShowCheckStateSummary (
    bool show )
```

If the box is checkable, enable showing a resume a la "3 Albums checked" in the combo box text. Default: True

### 6.70.1.11 updateText

```
void Digikam::AlbumSelectComboBox::updateText ( ) [virtual], [slot]
```

Updates the text describing the selection ("3 Albums selected"). Can be overridden to customize the default text.

## 6.80.1 Member Enumeration Documentation

### 6.80.1.1 RelativeSize

```
enum Digikam::AlbumThumbnailLoader::RelativeSize
```

Album thumbnail size is configurable via the settings menu. Some widgets use smaller icons than other widgets. These widgets do not need to know the currently set icon size from the setup and calculate a smaller size, but can simply request a relatively smaller icon. Depending on the user-chosen icon size, this size may in fact not be smaller than the normal size.

## 6.80.2 Member Function Documentation

### 6.80.2.1 getAlbumThumbnail()

```
bool Digikam::AlbumThumbnailLoader::getAlbumThumbnail (
    PAlbum *const album )
```

Request thumbnail for given album. The thumbnail will be loaded and returned asynchronously by the signals. If no thumbnail is associated with given album, no action will be taken, and false is returned.

### 6.80.2.2 getAlbumThumbnailDirectly()

```
QPixmap Digikam::AlbumThumbnailLoader::getAlbumThumbnailDirectly (
    PAlbum *const album )
```

Request thumbnail for given album, with slightly different behavior than the above method: If the thumbnail is already available in the cache, it is returned. If the icon is not yet loaded, it will be returned asynchronously by the signals, and a default icon is returned here. If no icon is associated, the default icon is returned.

### 6.80.2.3 getFaceThumbnailDirectly()

```
QPixmap Digikam::AlbumThumbnailLoader::getFaceThumbnailDirectly (
    TAlbum *const album )
```

Loads face tag thumbnail, like [getTagThumbnailDirectly\(\)](#) but loads thumbnails in the size for faces

### 6.80.2.4 getStandardTagIcon()

```
QPixmap Digikam::AlbumThumbnailLoader::getStandardTagIcon (
    RelativeSize size = NormalSize )
```

Return standard tag and album icons. The third methods check if album is the root, and returns the standard icon or the root standard icon.

### 6.80.2.5 getTagThumbnail()

```
bool Digikam::AlbumThumbnailLoader::getTagThumbnail (
    TAlbum *const album,
    QPixmap & icon )
```

Behaves similar to the above method. Tag thumbnails will be processed as appropriate. Tags may have associated an icon that is loaded synchronously by the system icon loader. In this case, icon is set to this icon, and false is returned. If no icon is associated with the tag, icon is set to null, and false is returned. If a custom icon is associated with the tag, it is loaded asynchronously, icon is set to null, and true is returned. Tag thumbnails are always smaller than album thumbnails - as small as an album thumbnail with SmallerSize. They are supposed to be blended into the standard tag icon obtained below, or used as is when SmallerSize is requested anyway.

#### Returns

Returns true if icon is loaded asynchronously.

### 6.80.2.6 `getTagThumbnailDirectly()`

```
QPixmap Digikam::AlbumThumbnailLoader::getTagThumbnailDirectly (
    TAlbum *const album )
```

Loads tag thumbnail, with slightly different behavior than the above method: If the thumbnail is already available in the cache, it is returned, already blended with the standard icon, if requested. If the icon is not yet loaded, it will be returned asynchronously by the signals (unblended), and a default icon is returned here. If no icon is associated, the default icon is returned.

### 6.80.2.7 `instance()`

```
AlbumThumbnailLoader * Digikam::AlbumThumbnailLoader::instance ( ) [static]
```

Return a preview of physical album directly without to use cache. Size of image can be passed as argument.

### 6.80.2.8 `setThumbnailSize()`

```
void Digikam::AlbumThumbnailLoader::setThumbnailSize (
    int size,
    int face )
```

Change the size of the thumbnails. If the size differs from the current size, `signalReloadThumbnails` will be emitted.

### 6.80.2.9 `signalDispatchThumbnailInternal`

```
void Digikam::AlbumThumbnailLoader::signalDispatchThumbnailInternal (
    int albumID,
    const QPixmap & thumbnail ) [signal]
```

Internal signal to dispatch `Album` thumbnail change.

### 6.80.2.10 `signalFailed`

```
void Digikam::AlbumThumbnailLoader::signalFailed (
    Album * album ) [signal]
```

This signal is emitted if thumbnail generation for given album failed. Same considerations as above.

### 6.80.2.11 `signalReloadThumbnails`

```
void Digikam::AlbumThumbnailLoader::signalReloadThumbnails ( ) [signal]
```

Indicates that all album and tag thumbnails need to be reloaded. This is usually because the icon size has changed in the setup.

### 6.80.2.12 signalThumbnail

```
void Digikam::AlbumThumbnailLoader::signalThumbnail (
    Album * album,
    const QPixmap & ) [signal]
```

This signal is emitted as soon as a thumbnail has become available for given album. This class is a singleton, so any object connected to this signal might not actually have requested a thumbnail for given url

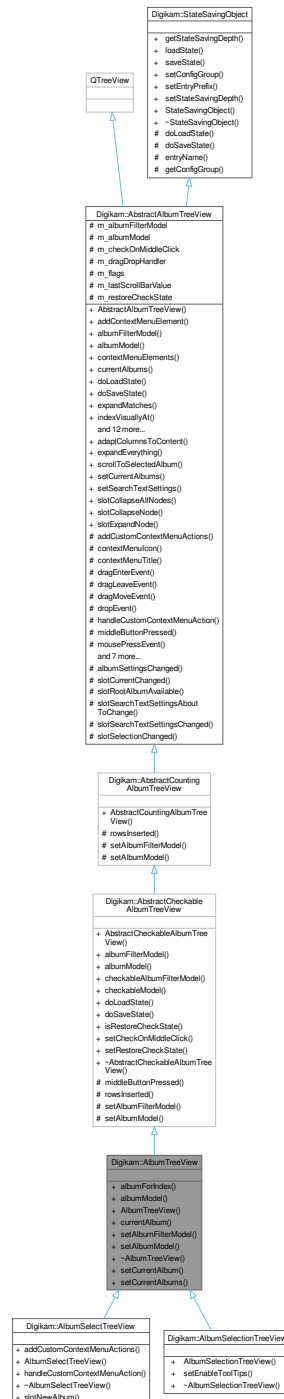

### 6.80.2.13 thumbnailSize()

```
int Digikam::AlbumThumbnailLoader::thumbnailSize ( ) const
```

Get the current default icon size

Ensure that the current language is added to the list of entries, even if the text is empty. [signalValueAdded\(\)](#) will be emitted.

### 6.85.2.2 allLanguagesRFC3066()

```
QStringList Digikam::AltLangStrEdit::allLanguagesRFC3066 ( ) [static]
```

Return all language codes available following the RFC 3066.

### 6.85.2.3 languageNameRFC3066()

```
QString Digikam::AltLangStrEdit::languageNameRFC3066 (
    const QString & code ) [static]
```

Return the literal name of RFC 3066 language code (format FR-fr for ex).

### 6.85.2.4 reset()

```
void Digikam::AltLangStrEdit::reset ( )
```

Reset widget, clear all entries

### 6.85.2.5 setLinesVisible()

```
void Digikam::AltLangStrEdit::setLinesVisible (
    uint lines )
```

Fix lines visible in text editor to lines. If zero, do not fix layout to number of lines visible.

### 6.85.2.6 setTitle()

```
void Digikam::AltLangStrEdit::setTitle (
    const QString & title )
```

Create a title widget with a QLabel and relevant text. If a title widget already exists, it's replaced.

### 6.85.2.7 setTitleWidget()

```
void Digikam::AltLangStrEdit::setTitleWidget (
    QWidget *const twdg )
```

Create a title with a specific widget instance (aka a QCheckBox for ex). If a title widget already exists, it's replaced.

### 6.85.2.8 signalModified

```
void Digikam::AltLangStrEdit::signalModified (
    const QString & lang,
    const QString & text ) [signal]
```

Emitted when the user changes the text for the current language.

### 6.85.2.9 signalSelectionChanged

```
void Digikam::AltLangStrEdit::signalSelectionChanged (
    const QString & lang ) [signal]
```

Emitted when the current language changed.

### 6.85.2.10 signalValueAdded

```
void Digikam::AltLangStrEdit::signalValueAdded (
    const QString & lang,
    const QString & text ) [signal]
```

Emitted when an entry for a new language is added.

### 6.85.2.11 signalValueDeleted

```
void Digikam::AltLangStrEdit::signalValueDeleted (
    const QString & lang ) [signal]
```

Emitted when the entry for a language is removed.

### 6.85.2.12 slotEnabledInternalWidgets

```
void Digikam::AltLangStrEdit::slotEnabledInternalWidgets (
    bool b ) [slot]
```

Can be used to turn on/off visibility of internal widgets. This do not includes the title widget.

### 6.85.2.13 titleWidget()

```
QWidget * Digikam::AltLangStrEdit::titleWidget ( ) const
```

Return the current title widget instance. If no previous call of [setTitle\(\)](#) or [setWidgetTitle\(\)](#), this function will return nullptr.

## 6.87.1 Member Function Documentation

### 6.87.1.1 setShallBeShown()

```
void Digikam::AnimatedClearButton::setShallBeShown (
    bool show )
```

Sets a primary condition for the button to be shown. If false, [animateVisible\(\)](#) will have no effect.

### 6.87.1.2 stayVisibleWhenAnimatedOut()

```
void Digikam::AnimatedClearButton::stayVisibleWhenAnimatedOut (
    bool stayVisible )
```

This parameter determines the behavior when the animation to hide the widget has finished: If stayVisible is true, the widget remains visible, but paints nothing. If stayVisible is false, setVisible(false) is called, which removes the widget for layouting etc. Default: false

Normal	Normal comparison using Qt's compare function.

## 6.92.2 Member Function Documentation

### 6.92.2.1 askGroupingOperateOnAll()

```
bool Digikam::ApplicationSettings::askGroupingOperateOnAll (
    OperationType type )
```

Asks the user whether the operation should be performed on all grouped images or just the first. Also supplies an option to remember the answer.

#### Parameters

<i>type</i>	Operation to be performed

```

Tells whether an operation should be performed on all grouped items or just the head item.

#### Parameters

<i>type</i>	Operation to be performed
-------------	---------------------------

**Returns**

Whether to apply to all images or just one, or ask

**6.92.2.3 getIconShowOverlays()**

```
bool Digikam::ApplicationSettings::getIconShowOverlays ( ) const
```

Determines whether the overlay buttons should be displayed on the icons.

**6.92.2.4 getStringComparisonType()**

## 6.97.1 Member Function Documentation

### 6.97.1.1 checkIndex()

```
bool Digikam::AssignNameOverlay::checkIndex (
    const QModelIndex & index ) const [override], [protected], [virtual]
```

Return true here if you want to show the overlay for the given index. The default implementation returns true.

Reimplemented from [Digikam::AbstractWidgetDelegateOverlay](#).

### 6.97.1.2 createWidget()

```
QWidget * Digikam::AssignNameOverlay::createWidget ( ) [override], [protected], [virtual]
```

Create your widget here. When creating the object, pass [parentWidget\(\)](#) as parent widget. Ownership of the object is passed. It will be deleted in [setActive\(false\)](#).

Implements [Digikam::AbstractWidgetDelegateOverlay](#).

### 6.97.1.3 setActive()

```
void Digikam::AssignNameOverlay::setActive (
    bool active ) [override], [protected], [virtual]
```

If active is true, this will call [createWidget\(\)](#), initialize the widget for use, and setup connections for the virtual slots. If active is false, this will delete the widget and disconnect all signal from model and view to this object (!)

Reimplemented from [Digikam::AbstractWidgetDelegateOverlay](#).

### 6.97.1.4 setFocusOnWidget()

```
void Digikam::AssignNameOverlay::setFocusOnWidget ( ) [override], [protected], [virtual]
```

Reimplement to set the focus on the correct subwidget. Default implementation sets focus on widget()

Reimplemented from [Digikam::PersistentWidgetDelegateOverlay](#).

### 6.97.1.5 showOnIndex()

```
void Digikam::AssignNameOverlay::showOnIndex (
    const QModelIndex & index ) [override], [protected], [virtual]
```

Reimplemented from [Digikam::PersistentWidgetDelegateOverlay](#).

### 6.97.1.6 updateFace()

```
void Digikam::AssignNameOverlay::updateFace ( ) [protected]
```

The order to plug these functions is important, since [setUserData\(\)](#) controls how the Overlay appears on a particular face.

### 6.97.1.7 viewportLeaveEvent()

```
void Digikam::AssignNameOverlay::viewportLeaveEvent (
    QObject * obj,
    QEvent * event ) [override], [protected], [virtual]
```

Called when a QEvent::Leave of the viewport is received. The default implementation [hide\(\)](#)s.

Reimplemented from [Digikam::AbstractWidgetDelegateOverlay](#).

### 6.97.1.8 visualChange()

```
void Digikam::AssignNameOverlay::visualChange ( ) [override], [protected], [virtual]
```

Called when any change from the delegate occurs - when the overlay is installed, when size hints, styles or fonts change

Reimplemented from [Digikam::ItemDelegateOverlay](#).

### 6.97.1.9 widgetEnterEvent()

```
void Digikam::AssignNameOverlay::widgetEnterEvent ( ) [override], [protected], [virtual]
```

Called when a QEvent::Enter resp. QEvent::Leave event for the widget is received. The default implementation does nothing.

Reimplemented from [Digikam::AbstractWidgetDelegateOverlay](#).

### 6.97.1.10 widgetLeaveEvent()

```

## 6.98.1 Constructor & Destructor Documentation

### 6.98.1.1 AssignNameWidget()

```
Digikam::AssignNameWidget::AssignNameWidget (
    QWidget *const parent = nullptr ) [explicit]
```

Please take care: you must set all four modes before usage!

## 6.98.2 Member Function Documentation

### 6.98.2.1 assigned

```
void Digikam::AssignNameWidget::assigned (
    const TaggingAction & action,
    const ItemInfo & info,
    const QVariant & faceIdentifier ) [signal]
```

A name has been assigned to the associated face. This can be an existing tag, or a new tag, as described by [TaggingAction](#). For convenience, info() and faceIdentifier() are provided.

### 6.98.2.2 ignoredClicked

```
void Digikam::AssignNameWidget::ignoredClicked (
    const ItemInfo & info,
    const QVariant & faceIdentifier ) [signal]
```

In IgnoredMode, this signal is emitted when the user clicked on the label.

### 6.98.2.3 labelClicked

```
void Digikam::AssignNameWidget::labelClicked (
    const ItemInfo & info,
    const QVariant & faceIdentifier ) [signal]
```

In ConfirmedMode, this signal is emitted when the user clicked on the label.

### 6.98.2.4 rejected

```
void Digikam::AssignNameWidget::rejected (
    const ItemInfo & info,
    const QVariant & faceIdentifier ) [signal]
```

The suggestion has been rejected and the face will be moved to Unknown. For convenience, info() and faceIdentifier() are provided.

### 6.98.2.5 selected

```
void Digikam::AssignNameWidget::selected (
    const TaggingAction & action,
    const ItemInfo & info,
    const QVariant & faceIdentifier ) [signal]
```

An action has been selected. This purely signals user interaction, no fixed decision - mouse hover may be enough to emit this signal. The action may be invalid (user switched back to empty selection).

### 6.98.2.6 setAlbumModels()

```
void Digikam::AssignNameWidget::setAlbumModels (
    TagModel *const model,
    TagPropertiesFilterModel *const filteredModel,
    CheckableAlbumFilterModel *const filterModel )
```

Set the tag model to use for completion.

### 6.98.2.7 setCurrentTag

```
void Digikam::AssignNameWidget::setCurrentTag (
    int tagId ) [slot]
```

Sets the suggested (UnconfirmedEditMode) or assigned (ConfirmedMode) tag to be displayed.

### 6.98.2.8 setMode()

```
void Digikam::AssignNameWidget::setMode (
    Mode mode )
```

Reject tooltip and icon should be updated even if the same mode is passed, because Unconfirmed and Unknown. Faces have the same mode but different tooltips and icons.

### 6.98.2.9 setParentTag

```
void Digikam::AssignNameWidget::setParentTag (
    TAlbum * album ) [slot]
```

Set a parent tag for suggesting a parent tag for a new tag, and a default action.

### 6.98.2.10 setUserData

```
void Digikam::AssignNameWidget::setUserData (
    const ItemInfo & info,
    const QVariant & faceIdentifier = QVariant() ) [slot]
```

The identifying information emitted with the signals. Ignored faces are drawn over with a different overlay, as Reject button should be disabled.

## 6.99.1 Member Function Documentation

### 6.99.1.1 updateRejectButton()

```
void Digikam::AssignNameWidget::Private::updateRejectButton ( )
```

Reject button shows different Tooltips and icons for Unconfirmed and Unknown faces, however both are of type UnconfirmedEditMode. This method is responsible for the Tooltip updates.

```

Standard constructor with image container to parse

## 6.102.2 Member Function Documentation

### 6.102.2.1 autoInnerCrop()

```
QRect Digikam::AutoCrop::autoInnerCrop ( ) const
```

Return inner crop area detected by [startAnalyse\(\)](#).

### 6.102.2.2 startAnalyse()

```
void Digikam::AutoCrop::startAnalyse ( ) [override], [virtual]
```

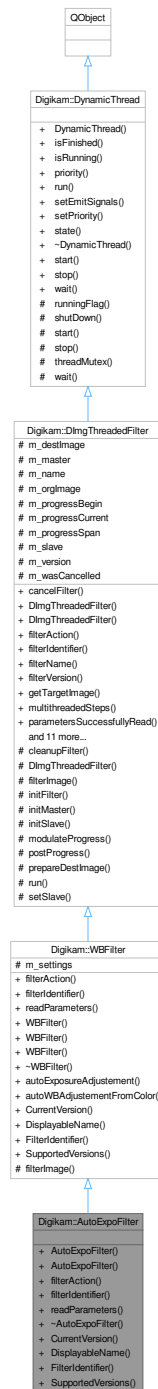

Perform auto-crop analyze to find best inner crop. Use [autoInnerCrop\(\)](#) to get computed area. This would be done in 4 steps

1. Search column wise: (a) From the left to the right, this is to get the left boundary (b) From the right to the left, this is to get the right boundary
2. Search row wise : (a) From the top to the bottom, this is to get the top boundary (b) From the bottom to the top, this is to get the bottom boundary

## 6.123.1 Member Enumeration Documentation

### 6.123.1.1 QueryStateEnum

```
enum Digikam::BdEngineBackend::QueryStateEnum
```

#### Enumerator

NoErrors	No errors occurred while executing the query.
SQLException	An SQLException has occurred while executing the query.
ConnectionError	An connection error has occurred while executing the query.

### 6.123.1.2 Status

```
enum Digikam::BdEngineBackend::Status
```

#### Enumerator

Unavailable	The database is not available, because it has not been opened yet or because of an error condition.
Open	The database is open. It has not been verified that the schema is up to date. This status is sufficient for use in a context where it can be assumed that the necessary schema check has been carried out by a master process.
OpenSchemaChecked	The database is open, and it has been verified that the schema is up to date, or the schema has been updated.

## 6.123.2 Constructor & Destructor Documentation

### 6.123.2.1 BdEngineBackend()

```
Digikam::BdEngineBackend::BdEngineBackend (
    const QString & backendName,
    DbEngineLocking *const locking ) [explicit]
```

Creates a database backend. The backend name is an arbitrary string that shall be unique for this backend object. It will be used to create unique connection names per backend and thread.

## 6.123.3 Member Function Documentation

### 6.123.3.1 asDBDateTime()

```
QDateTime Digikam::BdEngineBackend::asDBDateTime (
    const QDateTime & dateTime ) const
```

Depending on the database backend return a local or UTC date format. SQLite: local date format MySQL: UTC date format

### 6.123.3.2 beginTransaction()

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::beginTransaction ( )
```

Begin a database transaction

### 6.123.3.3 checkOrSetWALMode()

```
bool Digikam::BdEngineBackend::checkOrSetWALMode ( )
```

Check or set WAL mode for SQLite database if enabled in settings.

#### Returns

true the WAL mode is confirmed enabled.

### 6.123.3.4 close()

```
void Digikam::BdEngineBackend::close ( )
```

Close the database connection. Shall only be called from the thread that called [open\(\)](#).

### 6.123.3.5 commitTransaction()

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::commitTransaction ( )
```

Commit the current database transaction

### 6.123.3.6 configElement()

```
DbEngineConfigSettings Digikam::BdEngineBackend::configElement ( ) const
```

Return config read from XML, corresponding to this backend's database type.

### 6.123.3.7 connectionErrorHandling()

```
bool Digikam::BdEngineBackend::connectionErrorHandling (
    int retries )
```

Called when an attempted connection to the database failed. If it returns true, retry; if it returns false, bail out. Pass the number of connection retries to help with some decisions.

### 6.123.3.8 copyQuery()

```
DbEngineSqlQuery Digikam::BdEngineBackend::copyQuery (
    const DbEngineSqlQuery & old )
```

Creates a faithful copy of the passed query, with the current db connection.

**6.123.3.9 databaseType()**

```
BdEngineBackend::DbType Digikam::BdEngineBackend::databaseType ( ) const
```

Return the database type.

**6.123.3.10 exec()**

```
bool Digikam::BdEngineBackend::exec (
    DbEngineSqlQuery & query )
```

Calls exec/execBatch on the query, and handles debug output if something went wrong

**6.123.3.11 execDBAction() [1/2]**

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execDBAction (
    const DbEngineAction & action,
    const QMap< QString, QVariant > & bindingMap,
    QList< QVariant > *const values = nullptr,
    QVariant *const lastInsertId = nullptr )
```

Performs the database action on the current database. Queries by the specified parameters can have named parameters which are substituted with values from the bindingMap parameter. The result values (if any) are stored within the values list.

**6.123.3.12 execDBAction() [2/2]**

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execDBAction (
    const DbEngineAction & action,
    QList< QVariant > *const values = nullptr,
    QVariant *const lastInsertId = nullptr )
```

Performs the database action on the current database. Queries by the specified parameters mustn't have named parameters. The result values (if any) are stored within the values list.

**6.123.3.13 execDBActionQuery()**

```
QString Digikam::BdEngineBackend::execDBActionQuery (
    const DbEngineAction & action,
    const QMap< QString, QVariant > & bindingMap )
```

Performs the database action on the current database. Queries by the specified parameters can have named parameters which are substituted with values from the bindingMap parameter. The result values (if any) are stored within the values list. This method returns the last query, which is used to handle special cases.

**6.123.3.14 execDirectSql()**

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execDirectSql (
    const QString & query )
```

Calls exec on the query, and handles debug output if something went wrong. The query is not prepared, which can be fail in certain situations (e.g. trigger statements on QMYSQL).

### 6.123.3.15 execDirectSqlWithResult()

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execDirectSqlWithResult (
    const QString & query,
    QList< QVariant > *const values = nullptr,
    QVariant *const lastInsertId = nullptr )
```

Calls exec on the query, and handles debug output if something went wrong. The query is not prepared, which can fail in certain situations (e.g. trigger statements on QMYSQL).

### 6.123.3.16 execQuery() [1/3]

```
DbEngineSqlQuery Digikam::BdEngineBackend::execQuery (
    const QString & sql )
```

Executes the statement and returns the query object. Methods are provided for up to four bound values (positional binding), or for a list of bound values.

### 6.123.3.17 execQuery() [2/3]

```
DbEngineSqlQuery Digikam::BdEngineBackend::execQuery (
    const QString & sql,
    const QMap< QString, QVariant > & bindingMap )
```

Method which accept a hashmap with key, values which are used for named binding

### 6.123.3.18 execQuery() [3/3]

```
void Digikam::BdEngineBackend::execQuery (
    DbEngineSqlQuery & preparedQuery,
    const QVariant & boundValue1 )
```

Binds the values and executes the prepared query.

### 6.123.3.19 execSql() [1/2]

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execSql (
    const QString & sql,
    const QMap< QString, QVariant > & bindingMap,
    QList< QVariant > *const values = nullptr,
    QVariant *const lastInsertId = nullptr )
```

Method which accepts a map for named binding. For special cases it's also possible to add a [DbEngineActionType](#) which wraps another data object (also lists or maps) which can be used as field entry or as value (where it's prepared with positional binding). See more on [DbEngineActionType](#) class. If the wrapped data object is an instance of list, then the elements are separated by comma. If the wrapped data object is an instance of map, then the elements are inserted in the following way: key1=value1, key2=value2,...,keyN=valueN.

**6.123.3.20 execSql() [2/2]**

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execSql (
    const QString & sql,
    QList< QVariant > *const values = nullptr,
    QVariant *const lastInsertId = nullptr )
```

Executes the SQL statement, and write the returned data into the values list. If you are not interested in the returned data, set values to 0. Methods are provided for up to four bound values (positional binding), or for a list of bound values. If you want the last inserted id (and your query is suitable), set lastInsertId to the address of a QVariant. Additionally, methods are provided for prepared statements.

**6.123.3.21 execUpsertDBAction()**

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::execUpsertDBAction (
    const DbEngineAction & action,
    const QVariant & id,
    const QStringList & fieldNames,
    const QList< QVariant > & values )
```

Performs a special DBAction that is usually needed to "INSERT or UPDATE" entries in a table. The corresponding DBAction must contain exactly the named parameters :id, :fieldValueList, :fieldList and :valueList. You pass the value to be bound to the ":id" field, then two lists of the same size: The first containing the field names, the second one containing the values as QVariants ready for binding.

**6.123.3.22 getDBAction()**

```
DbEngineAction Digikam::BdEngineBackend::getDBAction (
    const QString & actionName ) const
```

Returns a database action with name, specified in actionName, for the current database.

**6.123.3.23 getQuery()**

```
DbEngineSqlQuery Digikam::BdEngineBackend::getQuery ( )
```

Creates an empty query object waiting for the statement

**6.123.3.24 handleQueryResult()**

```
BdEngineBackend::QueryState Digikam::BdEngineBackend::handleQueryResult (
    DbEngineSqlQuery & query,
    QList< QVariant > *const values,
    QVariant *const lastInsertId )
```

Checks if there was a connection error. If so [BdEngineBackend::ConnectionError](#) is returned. If not, the values are extracted from the query and inserted in the values list, the last insertion id is taken from the query and [BdEngineBackend::NoErrors](#) is returned.

### 6.123.3.25 isCompatible()

```
bool Digikam::BdEngineBackend::isCompatible (
    const DbEngineParameters & parameters )
```

Checks if the parameters can be used for this database backend.

### 6.123.3.26 isInTransaction()

```
bool Digikam::BdEngineBackend::isInTransaction ( ) const
```

Returns if the database is in a different thread in a transaction. Note that a transaction does not require holding [CoreDbAccess](#). Note that this does not give information about other processes locking the database.

### 6.123.3.27 lastError()

```
QString Digikam::BdEngineBackend::lastError ( )
```

Returns a description of the last error that occurred on this database. Use [CoreDbAccess::lastError](#) for errors presented to the user. This error will be included in that message. It may be empty.

### 6.123.3.28 lastSQLError()

```
QString Digikam::BdEngineBackend::lastSQLError ( )
```

Returns the last error that occurred on this database. Use [CoreDbAccess::lastError](#) for errors presented to the user. It may be empty.

### 6.123.3.29 maximumBoundValues()

```
int Digikam::BdEngineBackend::maximumBoundValues ( ) const
```

#### Returns

true on success

### 6.123.3.31 prepareQuery()

```
DbEngineSqlQuery Digikam::BdEngineBackend::prepareQuery (
    const QString & sql )
```

Creates a query object prepared with the statement, waiting for bound values

### 6.123.3.32 queryErrorHandling()

```
bool Digikam::BdEngineBackend::queryErrorHandling (
    DbEngineSqlQuery & query,
    int retries )
```

Called with a failed query. Handles certain known errors and debug output. If it returns true, reexecute the query; if it returns false, return it as failed. Pass the number of retries already done for this query to help with some decisions.

### 6.123.3.33 readToList()

```
QList< QVariant > Digikam::BdEngineBackend::readToList (
    DbEngineSqlQuery & query )
```

Reads data of returned result set into a list which is returned. The read process is column wise, which means all data elements of a row is read, then the resultset is switched to the next row.

### 6.123.3.34 rollbackTransaction()

```
void Digikam::BdEngineBackend::rollbackTransaction ( )
```

Rollback the current database transaction

### 6.123.3.35 setDbEngineErrorHandler()

```
void Digikam::BdEngineBackend::setDbEngineErrorHandler (
    DbEngineErrorHandler *const handler )
```

Add a [DbEngineErrorHandler](#). This object must be created in the main thread. If a database error occurs, this object can handle problem solving and user interaction.

### 6.123.3.36 setForeignKeyChecks()

```
void Digikam::BdEngineBackend::setForeignKeyChecks (
    bool check )
```

Enables or disables FOREIGN\_KEY\_CHECKS for the database. This function depends on the database engine.

### 6.123.3.37 status()

```
BdEngineBackend::Status Digikam::BdEngineBackend::status ( ) const
```

Returns the current status of the database backend

### 6.123.3.38 tables()

```
QStringList Digikam::BdEngineBackend::tables ( )
```

Returns a list with the names of tables in the database.

```
QSqlDatabase Digikam::BdEngineBackendPrivate::databaseForThread ( )
```

"A connection can only be used from within the thread that created it. Moving connections between threads or creating queries from a different thread is not supported." => one QSqlDatabase object per thread.     const DbEngineSqlQuery *const query )
```

Returns true if the query shall be retried.

```
void Digikam::BdEngineBackendPrivate::queryOperationWakeAll (
    BdEngineBackend::QueryOperationStatus status )
```

Set the wait flag to queryStatus and wake all waiting threads. Typically, call wakeAll with status ExecuteNormal or AbortQueries.

### 6.125.1.6 setQueryOperationFlag()

```
void Digikam::BdEngineBackendPrivate::setQueryOperationFlag (
    BdEngineBackend::QueryOperationStatus status )
```

Set the wait flag to queryStatus. Typically, call this with Wait.

## 6.125.2 Member Data Documentation

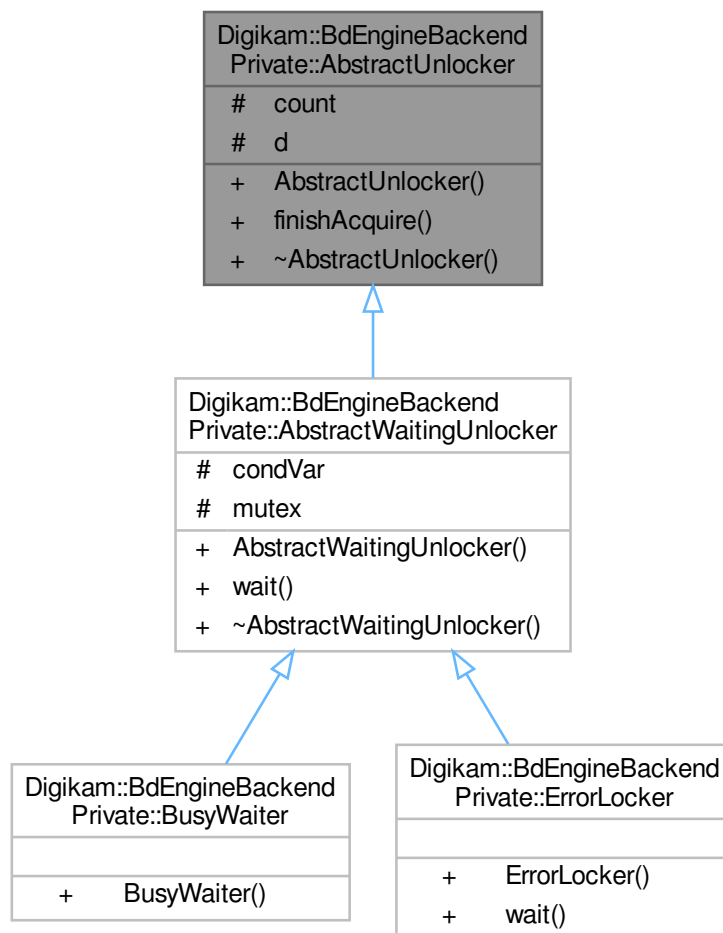

### 6.125.2.1 currentValidity

## 6.185.2 Member Function Documentation

### 6.185.2.1 [isFiltering\(\)](#)

```
bool Digikam::CheckableAlbumFilterModel::isFiltering ( ) const [override], [virtual]
```

Returns if the currently applied filters will result in any filtering.

#### Returns

`true` if the current selected filter could result in any filtering without checking if this really happens.

Reimplemented from [Digikam::AlbumFilterModel](#).

Reimplemented in [Digikam::SearchFilterModel](#), and [Digikam::TagPropertiesFilterModel](#).

### 6.185.2.2 matches()

```
bool Digikam::CheckableAlbumFilterModel::matches (  
    Album * album ) const [override], [protected], [virtual]
```

This method provides the basic match checking algorithm. Return true if this single album matches the current criteria. This method can be overridden to provide custom filtering.

**Parameters**

<i>album</i>	the album to tell if it matches the filter criteria or not.

```

Replace the standard combo box list view with a `QTreeView`. Call this after installing an appropriate model.

Reimplemented from [Digikam::ListViewComboBox](#).

### 6.186.2.2 setLabelText()

```
void Digikam::ChoiceSearchComboBox::setLabelText (

### 6.193.1 Member Enumeration Documentation

#### 6.193.1.1 Operation

enum [Digikam::CollectionImageChangeset::Operation](#)

#### Enumerator

Added	"Added" indicates that images have been added to albums.
Removed	"Removed" indicates that an image has been removed from the given album, and has possibly set a status of Removed and a null <a href="#">Album</a> (though this can already have changed to valid values), but the image-specific tables have not been removed.
RemovedAll	"RemovedAll" indicates that for all entries in the specified album, the "Removed" operation has been carried out. This is equivalent to a "Removed" changesets with all image ids in the list, but for RemovedAll, the list may not be explicitly given (may be empty).
Deleted	"Deleted" indicates that the image-specific tables have been removed from the database. While "Removed" means all data is still there, though possibly not accessible from an album, this means all data has been irreversibly deleted.
RemovedDeleted	Special combination: Images which has the "Removed" status have now been "Deleted". A changeset with Removed or RemovedAll is guaranteed to have been sent anytime before. Image ids nor albums ids may or may be not available in any combination.
Moved	Images have been moved. This is extra information; a Removed and then an Added changeset are guaranteed to be sent subsequently. <a href="#">Album</a> is the source album.
Copied	Images have been copied. This is extra information; an Added changeset is guaranteed to be sent subsequently. <a href="#">Album</a> is the source album.

## 6.193.2 Constructor & Destructor Documentation

### 6.193.2.1 CollectionImageChangeset()

```
Digikam::CollectionImageChangeset::CollectionImageChangeset ( ) [default]
```

An [CollectionImageChangeset](#) covers adding and removing an image to/from the collection. It is described by a list of affected image ids, a list of affected albums, and an operation. Special Case "RemovedAll": If all images have been removed from an album, operation is RemovedAll, the album list contains the (now empty) albums, [ids\(\)](#) is empty, but [containsImage\(\)](#) always returns true. Special Case "RemovedDeleted": Images with the "Removed" status are now irreversibly deleted. [ids\(\)](#) and/or [albums\(\)](#) may be empty (this means information is not available).

## 6.193.3 Member Function Documentation

### 6.193.3.1 ids()

```
QList< qlonglong > Digikam::CollectionImageChangeset::ids ( ) const
```

Specification of this changeset. All special cases where the returned list may be empty are noted above. The lists are valid unless such a case is explicitly mentioned.

### 6.193.3.2 operator<<()

```
CollectionImageChangeset & Digikam::CollectionImageChangeset::operator<< (
    const CollectionImageChangeset & other )
```

Combines two CollectionImageChangesets. The operations shall not differ between the two sets; the operation is set to Unknown if it differs. This is especially not suitable for RemovedAll changesets.

## 6.194.1 Member Enumeration Documentation

### 6.194.1.1 CaseSensitivity

```
enum Digikam::CollectionLocation::CaseSensitivity
```

#### Enumerator

<code>UnknownCaseSensitivity</code>	The location has an unknown case sensitivity.
<code>CaseInsensitive</code>	The location is case insensitive.
<code>CaseSensitive</code>	The location is case sensitive.

### 6.194.1.2 Status

```
enum Digikam::CollectionLocation::Status
```

## Enumerator

LocationNull	An invalid status. A location has this status if it is not valid, and it had this status before its creation (for oldStatus information)
LocationAvailable	The location if available. This is the most common status.
LocationHidden	The location is explicitly hidden. This gives no information if the location was available were it not hidden.
LocationUnavailable	The location is currently not available. (Harddisk unplugged, CD not in drive, network fs not mounted etc.) It may become available any time.
LocationDeleted	An invalid status. A location object acquires this status if it has been deleted. The object then does no longer point to an existing location.

## 6.194.1.3 Type

```
enum Digikam::CollectionLocation::Type
```

## Enumerator

Undefined	The location is undefined. Keep values constant.
VolumeHardWired	The location is located on a storage device that is built-in without frequent removal: Hard-disk inside the machine.
VolumeRemovable	The location is located on a storage device that can be removed from the local machine, and is expected to be removed. USB stick, USB hard-disk, CD, DVD
Network	The location is available via a network file system. The availability depends on the network connection.

## 6.194.2 Member Function Documentation

```

The current status. See above for possible values.

**6.194.2.7 type()**

```
CollectionLocation::Type Digikam::CollectionLocation::type ( ) const
```

The type of location. See above for possible values.

## 6.195.1 Member Enumeration Documentation

### 6.195.1.1 LocationCheckResult

```
enum Digikam::CollectionManager::LocationCheckResult
```

#### Enumerator

LocationInvalidCheck	The check did not succeed, status unknown.
LocationAllRight	All right. The accompanying message may be empty.
LocationHasProblems	Location can be added, but the user should be aware of a problem.
LocationNotAllowed	Adding the location will fail (e.g. there is already a location for the path)

## 6.195.2 Member Function Documentation

### 6.195.2.1 addLocation()

```
CollectionLocation Digikam::CollectionManager::addLocation (
    const QUrl & fileUrl,
    const QString & label = QString() )
```

Add the given file system location as new collection location. Type and availability will be detected. On failure returns null. This would be the case if the given url is already contained in another collection location. You may

pass an optional user-visible label that will be stored in the database. The label has no further meaning and can be freely chosen.

[CollectionLocation](#) objects returned are simple data containers. If the corresponding location is returned, the data is still safe to access, but does not represent anything. Therefore, do not store returned objects, but prefer to retrieve them freshly.

#### 6.195.2.2 album()

```
QString Digikam::CollectionManager::album (
    const QUrl & fileUrl )
```

Returns the album part of the given file path, i.e. the album root path at the beginning is removed and the second part, starting with "/", ending without a slash, is returned. Example: "/media/fotos/Paris 2007" gives "/Paris 2007" Returns a null QString if the file path is not located in an album root. Returns "/" if the file path is an album root. Note that trailing slashes are removed in the return value, regardless if there was one or not. Note that you have to feed a path/url pointing to a directory. File names cannot be recognized as such by this method, and will be treated as a directory.

#### 6.195.2.3 albumRoot()

```
QUrl Digikam::CollectionManager::albumRoot (
    const QUrl & fileUrl )
```

For a given path, the part of the path that forms the album root is returned, ending without a slash. Example: "/media/fotos/Paris 2007" gives "/media/fotos". Only available (or hidden, but available) album roots are guaranteed to be found.

#### 6.195.2.4 albumRootLabel()

```
QString Digikam::CollectionManager::albumRootLabel (
    int id )
```

Returns the album root label with the given id. Returns a null QString if the root path does not exist or is not available.

#### 6.195.2.5 albumRootPath()

```
QString Digikam::CollectionManager::albumRootPath (
    int id )
```

Returns the album root path with the given id. Returns a null QString if the root path does not exist or is not available.

#### 6.195.2.6 allAvailableAlbumRootPaths()

```
QStringList Digikam::CollectionManager::allAvailableAlbumRootPaths ( )
```

Returns a list of the paths of all currently available root paths

### 6.195.2.7 allAvailableLocations()

```
QList< CollectionLocation > Digikam::CollectionManager::allAvailableLocations ( )
```

Returns a list of all currently available CollectionLocations

### 6.195.2.8 allLocations()

```
QList< CollectionLocation > Digikam::CollectionManager::allLocations ( )
```

Returns a list of all CollectionLocations stored in the database

### 6.195.2.9 changeType()

```
void Digikam::CollectionManager::changeType (
    const CollectionLocation & location,
    int type )
```

Changes the [CollectionLocation::Type](#) of the given location

### 6.195.2.10 checkHardWiredLocations()

```
QList< CollectionLocation > Digikam::CollectionManager::checkHardWiredLocations ( )
```

Checks the locations of type HardWired. If one of these is not available currently, it is added to the list of disappeared locations. This case may happen if a file system is changed, a backup restored or other actions taken that change the UUID, although the data may still be available and mounted. If there are hard-wired volumes available which are candidates for a newly appeared volume (in fact those that do not contain any collections currently), they are added to the map, identifier -> i18n'ed user presentable description. The identifier can be used for changeVolume.

### 6.195.2.11 checkLocation()

```
CollectionManager::LocationCheckResult Digikam::CollectionManager::checkLocation (
    const QUrl & filePath,
    QList< CollectionLocation > & assumeDeleted,
    QString * message = nullptr,
    QString * suggestedMessageIconName = nullptr )
```

Analyzes the given file path. Creates an info message describing the result of identification or possible problems. The text is i18n'ed and can be presented to the user. The returned result enum describes the test result.

### 6.195.2.12 isAlbumRoot() [1/2]

```
bool Digikam::CollectionManager::isAlbumRoot (
    const QString & filePath )
```

The file path should not end with the directory slash. Using [CoreDbUrl](#)'s method is fine.

**6.195.2.13 isAlbumRoot()** [2/2]

```
bool Digikam::CollectionManager::isAlbumRoot (
    const QUrl & fileUrl )
```

Returns true if the given path forms an album root. It will return false if the path is a path below an album root, or if the path does not belong to an album root. Example: `"/media/fotos/Paris 2007"` is an album with album root `"/media/fotos"`. `"/media/fotos"` returns true, `"/media/fotos/Paris 2007"` and `"/media"` return false. Only available (or hidden, but available) album roots are guaranteed to be found.

**6.195.2.14 locationForAlbumRoot()**

```
CollectionLocation Digikam::CollectionManager::locationForAlbumRoot (
    const QUrl & fileUrl )
```

Returns the [CollectionLocation](#) that contains the given album root. The path must be an album root with [isAlbumRoot\(\)](#) == true. Returns 0 if no collection location matches. Only available (or hidden, but available) locations are guaranteed to be found.

**6.195.2.15 locationForAlbumRootId()**

```
CollectionLocation Digikam::CollectionManager::locationForAlbumRootId (
    int id )
```

Returns the location for the given album root id

**6.195.2.16 locationForUrl()**

```
CollectionLocation Digikam::CollectionManager::locationForUrl (
    const QUrl & fileUrl )
```

Returns the [CollectionLocation](#) that contains the given path. Equivalent to calling `locationForAlbumRoot(albumRoot(fileUrl))`. Only available (or hidden, but available) locations are guaranteed to be found.

**6.195.2.17 locationPropertiesChanged**

```
void Digikam::CollectionManager::locationPropertiesChanged (
    const CollectionLocation & location ) [signal]
```

Emitted when the label of a collection location is changed

**6.195.2.18 locationStatusChanged**

```
void Digikam::CollectionManager::locationStatusChanged (
    const CollectionLocation & location,
    int oldStatus ) [signal]
```

Emitted when the status of a collection location changed. This means that the location became available, hidden or unavailable.

An added location will change its status after addition, from Null to Available, Hidden or Unavailable.

A removed location will change its status to Deleted during the removal; in this case, you shall not use the object passed with this signal with any method of [CollectionManager](#).

The second signal argument is of type [CollectionLocation::Status](#) and describes the status before the state change occurred

### 6.195.2.19 migrateToVolume()

```
void Digikam::CollectionManager::migrateToVolume (
    const CollectionLocation & location,
    const QString & identifier )
```

Migrates the existing collection to a new volume, identified by an internal identifier as returned by [checkHardWiredLocations\(\)](#). Use this *only* to react to changes like those detailed for [checkHardWiredLocations](#); the actual data pointed to shall be unchanged.

### 6.195.2.20 migrationCandidates()

```
void Digikam::CollectionManager::migrationCandidates (
    const CollectionLocation & disappearedLocation,
    QString *const technicalDescription,
    QStringList *const candidateIdentifiers,
    QStringList *const candidateDescriptions )
```

For a given disappeared location (retrieved from [checkHardWiredLocations\(\)](#)) retrieve a user-presentable technical description (excluding the [CollectionLocation](#)'s label) and a list of identifiers and corresponding user presentable strings of candidates to where the given location may have been moved.

### 6.195.2.21 oneAlbumRoot()

```
QUrl Digikam::CollectionManager::oneAlbumRoot ( )
```

Returns just one album root, out of the list of available location, the one that is most suitable to serve as a default, e.g. to suggest as default place when the user wants to add files.

### 6.195.2.22 refresh()

```
void Digikam::CollectionManager::refresh ( )
```

Clears all locations and re-reads the lists of collection locations. Enables the watch.

### 6.195.2.23 removeLocation()

```
void Digikam::CollectionManager::removeLocation (
    const CollectionLocation & location )
```

Removes the given location. This means that all images contained on the location will be removed from the database, all tags will be lost.

### 6.195.2.24 setLabel()

```
void Digikam::CollectionManager::setLabel (
    const CollectionLocation & location,
    const QString & label )
```

Sets the label of the given location

### 6.195.2.25 setWatchDisabled()

```
void Digikam::CollectionManager::setWatchDisabled ( )
```

Disables the collection watch. It will be reenabled as soon as [refresh\(\)](#) is called or any other action triggered.

## 6.198.1 Member Enumeration Documentation

### 6.198.1.1 FileScanMode

enum `Digikam::CollectionScanner::FileScanMode`

#### Enumerator

NormalScan	The file will be scanned like it is done for any usual scan. If it was not modified, no further action is taken. If the file is not known yet, it will be fully scanned, or, if an identical file is found, this data will be copied.
ModifiedScan	The file will scanned like a modified file. Only a selected portion of the metadata will be updated into the database. If the file is not known yet, it will be fully scanned, or, if an identical file is found, this data will be copied.
Rescan	The file will be scanned like a completely new file. The complete metadata is re-read into the database. No search for identical files will be done.
CleanScan	This is the same as Rescan but the database metadata will be cleaned up if the corresponding metadata write option is enabled.

## 6.198.2 Member Function Documentation

### 6.198.2.1 cancelled

```
void Digikam::CollectionScanner::cancelled ( ) [signal]
```

Emitted when the observer told to cancel the scan

### 6.198.2.2 completeScan()

```
void Digikam::CollectionScanner::completeScan ( )
```

Carries out a full scan on all available parts of the collection. Only a full scan can finally remove deleted files from the database, only a full scan will mark the database as scanned. The database will be locked while running (Note: this is not done for partialScans).

### 6.198.2.3 copyFileProperties()

```
void Digikam::CollectionScanner::copyFileProperties (
    const ItemInfo & source,
    const ItemInfo & dest ) [static]
```

When a file is derived from another file, typically through editing, copy all relevant attributes from source file to the new file.

### 6.198.2.4 createHintContainer()

```
CollectionScannerHintContainer * Digikam::CollectionScanner::createHintContainer ( ) [static]
```

Hints give the scanner additional info about things that happened in the past carried out by higher level which the collection scanner cannot know. They allow to carry out optimizations. Record hints in a container, and provide the container to the collection scanner. The Container set in setHintContainer must be one created by createContainer.

### 6.198.2.5 databaseInitialScanDone()

```
bool Digikam::CollectionScanner::databaseInitialScanDone ( ) [static]
```

Returns if the initial scan of the database has been done. This is the first complete scan after creation of a new database file (or update requiring a rescan)

### 6.198.2.6 finishCompleteScan()

```
void Digikam::CollectionScanner::finishCompleteScan (
    const QStringList & albumPaths )
```

If you enable deferred file scanning for a [completeScan\(\)](#), new files will not be scanned. The relevant albums are available from [deferredAlbumPaths\(\)](#) when [completeScan\(\)](#) has finished. You need to call [finishCompleteScan\(\)](#) afterwards with the list to get the same complete scan than undeferred [completeScan\(\)](#).

### 6.198.2.7 finishedScanningAlbumRoot

```
void Digikam::CollectionScanner::finishedScanningAlbumRoot (
    const QString & albumRoot ) [signal]
```

Emitted when the scanning has finished. Note that start/finishScanningAlbum may be emitted recursively.

### 6.198.2.8 getNewIdsList()

```
QList< qlonglong > Digikam::CollectionScanner::getNewIdsList ( ) const
```

Returns item ids from new detected items

### 6.198.2.9 partialScan() [1/2]

```
void Digikam::CollectionScanner::partialScan (
    const QString & albumRoot,
    const QString & album )
```

Same procedure as above, but albumRoot and album is provided.

### 6.198.2.10 partialScan() [2/2]

```
void Digikam::CollectionScanner::partialScan (
    const QString & filePath )
```

Carries out a partial scan on the specified path of the collection. The includes scanning for new files + albums and updating modified file data. Files no longer found in the specified path however are not completely removed, but only marked as removed. They will be removed only after a complete scan.

### 6.198.2.11 safelyRemoveAlbums()

```
void Digikam::CollectionScanner::safelyRemoveAlbums (
    const QList< int > & albumIds )
```

Prepare the given albums to be removed, typically by setting the albums as orphan and removing all entries from the albums

### 6.198.2.12 scanFile() [1/3]

```
void Digikam::CollectionScanner::scanFile (
    const ItemInfo & info,
    FileScanMode mode = ModifiedScan )
```

The given file represented by the [ItemInfo](#) will be scanned according to mode

**6.198.2.13 scanFile() [2/3]**

```
qulonglong Digikam::CollectionScanner::scanFile (
    const QString & albumRoot,
    const QString & album,
    const QString & fileName,
    FileScanMode mode = ModifiedScan )
```

Same procedure as above, but albumRoot and album is provided. If you already have this info it need not be retrieved. Returns the image id of the file, or -1 on failure.

**6.198.2.14 scanFile() [3/3]**

```
qulonglong Digikam::CollectionScanner::scanFile (
    const QString & filePath,
    FileScanMode mode = ModifiedScan )
```

The given file will be scanned according to the given mode. Returns the image id of the file.

**6.198.2.15 scannedFiles**

```
void Digikam::CollectionScanner::scannedFiles (
    int filesScanned ) [signal]
```

Emitted between startScanningAlbum and finishedScanningAlbum. In between these two signals, the sum of files Scanned of all sent signals equals the one reported by finishedScanningAlbum()

**6.198.2.16 setNeedFileCount()**

```
void Digikam::CollectionScanner::setNeedFileCount (
    bool on )
```

Call this to enable emitting the total files to scan (for progress info) before a complete collection scan. Default is off. If on, setSignalEnabled() must be on to take effect.

**6.198.2.17 setObserver()**

```
void Digikam::CollectionScanner::setObserver (
    CollectionScannerObserver *const observer )
```

Set an observer to be able to cancel a running scan

**6.198.2.18 setPerformFastScan()**

```
void Digikam::CollectionScanner::setPerformFastScan (
    bool on )
```

Call this to disable fast scan with album date check. Default is on.

**6.198.2.19 setSignalsEnabled()**

```
void Digikam::CollectionScanner::setSignalsEnabled (
    bool on )
```

Call this to enable the progress info signals. Default is off.

**6.198.2.20 startScanningAlbumRoot**

```
void Digikam::CollectionScanner::startScanningAlbumRoot (
    const QString & albumRoot ) [signal]
```

Notifies the begin of the scanning of the specified album root, album, of stale files, or of the whole collection (after stale files)

**6.198.2.21 totalFilesToScan**

```
void Digikam::CollectionScanner::totalFilesToScan (
    int count ) [signal]
```

Emitted once in scanAlbums(), the scan() methods, and updateItemsWithoutDate(). Gives the number of the files that need to be scanned.

## 6.211.1 Member Function Documentation

### 6.211.1.1 colorLabels()

```
QList< ColorLabel > Digikam::ColorLabelWidget::colorLabels ( ) const
```

Return the list of Color Label buttons turned on or an empty list of none.

### 6.211.1.2 `setButtonsExclusive()`

```
void Digikam::ColorLabelWidget::setButtonsExclusive (
    bool b )
```

Set all Color Label buttons exclusive or not. Default is true as only one can be selected. Non-exclusive mode is dedicated for Advanced Search tool.

### 6.211.1.3 `setColorLabels()`

```
void Digikam::ColorLabelWidget::setColorLabels (
    const QList< ColorLabel > & list )
```

Turn on Color Label buttons using list. Pass an empty list to clear all selection.

### 6.211.1.4 `setDescriptionBoxVisible()`

```
void Digikam::ColorLabelWidget::setDescriptionBoxVisible (
    bool b )
```

Show or not on the bottom view the description of label with shortcuts.

### 6.212.1.2 `startEditing()`

```
void Digikam::ComboBoxDelegate::startEditing (

## 6.218.1 Detailed Description

The ContextMenuHelper class helps adding commonly used actions and menus. Use this class to add

- actions from the actionCollection
- standard actions (copy, paste, delete)
- temporary actions
- predefined special actions
- predefined submenus to the menu.

All [addAction\(\)](#) methods take a special parameter 'addDisabled'. This parameter controls if disabled actions are added to the menu. Normally adding disabled actions is turned off, to clean up the menu and make it more readable.

If the ContextMenuHelper class is used, you need to call its own [exec\(\)](#) method, instead the one from the parent menu. This way signals from special menus can be emitted and connected to the appropriate slots.

## 6.218.2 Constructor & Destructor Documentation

### 6.218.2.1 ContextMenuHelper()

```
Digikam::ContextMenuHelper::ContextMenuHelper (
    QMenu *const parent ) [explicit]
```

Constructs the helper class.

#### Parameters

<i>parent</i>	the menu the helper class is linked to
---------------	--

## 6.218.3 Member Function Documentation

### 6.218.3.1 addAction() [1/3]

```
void Digikam::ContextMenuHelper::addAction (
    const QString & name,
    bool addDisabled = false )
```

Add an action from the actionCollection.

This method adds actions from the actionCollection. The actionCollection can be set in the constructor of the [ContextMenuHelper](#) class.

#### Parameters

<i>name</i>	the name of the action in the actionCollection
<i>addDisabled</i>	if set, disabled actions are added to the menu

**6.218.3.2 addAction() [2/3]**

```
void Digikam::ContextMenuHelper::addAction (
    QAction *const action,
    bool addDisabled = false )
```

Add a temporary action.

Sometimes it is necessary to define actions that only exist in the current context menu content. Use this method to add such an action.

**Parameters**

<i>action</i>	the action to add
<i>addDisabled</i>	if set, disabled actions are added to the menu

**6.218.3.3 addAction() [3/3]**

```
void Digikam::ContextMenuHelper::addAction (
    QAction *const action,
    QObject *const recv,
    const char *const slot,
    bool addDisabled = false )
```

Add a temporary action and assign it to a custom slot.

Use this method if you want to add a temporary action and immediately connect it to the receiving slot.

**Parameters**

<i>action</i>	the action to add
<i>recv</i>	the receiver of the triggered action
<i>slot</i>	the slot to connect the triggered action to
<i>addDisabled</i>	if set, disabled actions are added to the menu

**6.218.3.4 addActionDeleteFaceTag()**

```
void Digikam::ContextMenuHelper::addActionDeleteFaceTag (
    TagModificationHelper *const helper,
    TAlbum *const tag )
```

Add action to delete tags from people sidebar.

**6.218.3.5 addActionNewAlbum()**

```
void Digikam::ContextMenuHelper::addActionNewAlbum (
    AlbumModificationHelper *const helper,
    PAlbum *const parentAlbum = nullptr )
```

Add actions to add, remove or edit a tag. The tag modification helper is used to execute the action. You must set the parent tag to use on modification helper.

### 6.218.3.6 addActionNewTag()

```
void Digikam::ContextMenuHelper::addActionNewTag (
    TagModificationHelper *const helper,
    TAlbum *const parentTag = nullptr )
```

Add actions to add, remove or edit a tag. The tag modification helper is used to execute the action. You must set the parent tag to use on modification helper.

### 6.218.3.7 addActionTagToFaceTag()

```
void Digikam::ContextMenuHelper::addActionTagToFaceTag (
    TagModificationHelper *const helper,
    TAlbum *const tag )
```

Add action to set tags as face tags.

### 6.218.3.8 addAlbumCheckUncheckActions()

```
void Digikam::ContextMenuHelper::addAlbumCheckUncheckActions (
    Album *const album )
```

Add a Select and Deselect menu to check and uncheck albums. Note: Call setAlbumModel before, or this will have no effect.

### 6.218.3.9 addAssignTagsMenu()

```
void Digikam::ContextMenuHelper::addAssignTagsMenu (
    const imageIds & ids )
```

Add "Assign Tags" menu.

This menu will provide a list of all tags available so that they can be assigned to the current selected items.

To make this menu work, you need to run `exec()` from this class, otherwise the signals are not emitted and you will not be able to react on triggered actions from this menu. Make sure to connect the signals to the appropriate slots in the context menu handling method.

#### Parameters

<code>ids</code>	the selected items
------------------	--------------------

#### See also

[exec\(\)](#)  
[signalAssignTag\(\)](#)

### 6.218.3.10 addCreateTagFromAddressbookMenu()

```
void Digikam::ContextMenuHelper::addCreateTagFromAddressbookMenu ( )
```

Add a menu to create new tags from adressbook entries.

### 6.218.3.11 addExportMenu()

```
void Digikam::ContextMenuHelper::addExportMenu ( )
```

Add Export Webservices actions menu.

### 6.218.3.12 addGotoMenu()

```
void Digikam::ContextMenuHelper::addGotoMenu (
    const imageIds & ids )
```

Add the Goto menu.

This menu will provide the following actions for the given item:

- Goto [Album](#)
- Goto Date
- Goto Tag To make this menu work, you need to run [exec\(\)](#) from this class, otherwise the signals are not emitted and you will not be able to react on triggered actions from this menu. Make sure to connect the signals to the appropriate slots in the context menu handling method.

#### Parameters

<i>ids</i>	the list of selected items
------------	----------------------------

void Digikam::ContextMenuHelper::addGroupMenu (
    const imageIds & ids,
    const QList< QAction * > & extraMenuItems = QList<QAction*> ( ) )
```

Add a "Group" menu. This menu will provide actions open, close, add to, remove from, or split a group.

`addGroupActions` will add the actions as a flat list, not in a submenu. Note: Call `setItemFilterModel` before to have Open/Close group actions.

### 6.218.3.14 addImportMenu()

```
void Digikam::ContextMenuHelper::addImportMenu ( )
```

Add Import Webservices actions menu.

### 6.218.3.15 addIQSAction()

### 6.218.3.16 addLabelsAction()

```
void Digikam::ContextMenuHelper::addLabelsAction ( )
```

Add "Pick/Color/Rating Labels" action.

This action will provide methods to assign pick/color/rating labels to the currently selected items.

To make this menu work, you need to run [exec\(\)](#) from this class, otherwise the signals are not emitted and you will not be able to react on triggered actions from this menu. Make sure to connect the signals to the appropriate slots in the context menu handling method.

```
void Digikam::ContextMenuHelper::addServicesMenu (
    const QList< QUrl > & selectedItems )

Add the standard delete action and connect it to the appropriate slot

**Parameters**

<i>recv</i>	the receiver of the triggered action
<i>slot</i>	the slot to connect the triggered action to
<i>quantity</i>	the number of the files that should be deleted. This parameter is used for the action name and is normally used when deleting more then one item.

**6.218.3.26 addStandardActionLightTable()**

```
void Digikam::ContextMenuHelper::addStandardActionLightTable ( )
```

Add the lighttable action to the menu.

Do not use [addAction\(\)](#) to add the lighttable action, because we need to handle special cases here. Depending on whether the lighttable window has already been created and filled with items, we set different actions.

**6.218.3.27 addStandardActionPaste()**

```
void Digikam::ContextMenuHelper::addStandardActionPaste (

## Parameters

<i>ids</i>	the selected items in the current view
<i>album</i>	the current album the AlbumIconView is displaying

```
QAction * Digikam::ContextMenuHelper::exec (
    const QPoint & pos,
    QAction *const at = nullptr )
```

Execute the registered parent menu and evaluate the triggered actions.

Always use this method instead the one from the parent menu. It will ensure that the signals are emitted and special cases are handled.

## Parameters

<i>pos</i>	position of the triggered action in the registered menu
<i>at</i>	the action that should be at the position pos

## Returns

the triggered action

**6.218.3.31 setAlbumModel()**

```
void Digikam::ContextMenuHelper::setAlbumModel (
    AbstractCheckableAlbumModel *const model )

## Friends

- class **CoreDbAccessUnlock**

### 6.224.1 Detailed Description

The [CoreDbAccess](#) provides access to the database: Create an instance of this class on the stack to retrieve a pointer to the database. While you hold an instance of [CoreDbAccess](#), the database access is locked for other threads, but *not* for other processes. This is due to the fact that while databases allow concurrent access (of course), their client libs may not be thread-safe.

When initializing your application, you need to call two methods:

- in a not-yet-multithreaded context, you need to call `setParameters`
- to make sure that the database is available and the schema is properly initialized, call [checkReadyForUse\(\)](#)

### 6.224.2 Constructor & Destructor Documentation

#### 6.224.2.1 CoreDbAccess()

```
Digikam::CoreDbAccess::CoreDbAccess ( )
```

Create a [CoreDbAccess](#) object for the default database. Note that when initializing your app, `setParameters` need to be called (in a not-yet-multithreaded context) for this to work. If the database is not yet opened, it will be opened. The schema will not be checked, use [checkReadyForUse\(\)](#) for a full opening process including schema update and error messages.

### 6.224.3 Member Function Documentation

#### 6.224.3.1 backend()

```
CoreDbBackend * Digikam::CoreDbAccess::backend ( ) const
```

Retrieve a pointer to the database backend

#### 6.224.3.2 checkReadyForUse()

```
bool Digikam::CoreDbAccess::checkReadyForUse (
    InitializationObserver *const observer = nullptr ) [static]
```

Method to one-time initialize a database when new parameters have been set: Make sure that the database is open, that the schema has properly been initialized. If the parameters were not changed, this method has no effect.

## Returns

if the database is ready for use

### 6.224.3.3 cleanUpDatabase()

```
void Digikam::CoreDbAccess::cleanUpDatabase ( ) [static]
```

Clean up the database access. When this function has been called, the access can be restored by calling `setParameters`. Construction a database access object otherwise after calling this method will crash.

### 6.224.3.4 databaseWatch()

```
CoreDbWatch * Digikam::CoreDbAccess::databaseWatch ( ) [static]
```

Return the [CoreDbWatch](#).

### 6.224.3.5 db()

```
CoreDB * Digikam::CoreDbAccess::db ( ) const
```

Retrieve a pointer to the album database

### 6.224.3.6 initDbEngineErrorHandler()

```
void Digikam::CoreDbAccess::initDbEngineErrorHandler (
    DbEngineErrorHandler *const errorHandler ) [static]
```

[Setup](#) the errors handler instance.

### 6.224.3.7 lastError()

```
QString Digikam::CoreDbAccess::lastError ( )
```

Returns the error message for the last error that occurred, or a null QString of no error occurred.

### 6.224.3.8 parameters()

```
DbEngineParameters Digikam::CoreDbAccess::parameters ( ) [static]
```

Return the default parameters

### 6.224.3.9 setLastError()

```
void Digikam::CoreDbAccess::setLastError (
    const QString & error )
```

Set the "last error" message. This method is not for public use.

### 6.224.3.10 setParameters()

```
void Digikam::CoreDbAccess::setParameters (
    const DbEngineParameters & parameters ) [static]
```

Set the default parameters. Call this function at least once in the starting phase of your application, when no other threads will yet access the database, to initialize DatabaseAccess. After this initial call, it is thread-safe to call this function again. In a subsequent call, if the parameters are identical, nothing is done. If the parameters change, the current database will be closed. When parameters have been set or changed, the new one will be opened on-demand, i.e. when the first [CoreDbAccess](#) object is constructed.

#### 6.225.1.1 CoreDbAccessUnlock()

```
Digikam::CoreDbAccessUnlock::CoreDbAccessUnlock ( )
```

Acquire an object of this class if you want to assure that the [CoreDbAccess](#) is *not* held during the lifetime of the object. At creation, the lock is obtained shortly, then all locks are released. At destruction, all locks are acquired again. If you need to access any locked structures during lifetime, acquire a new [CoreDbAccess](#).

- [CoreDbOperationGroup](#) ()
- [CoreDbOperationGroup](#) ([CoreDbAccess](#) \*const access)
- void [lift](#) ()
- void [resetTime](#) ()
- void [setMaximumTime](#) (int msec)

### 6.232.1 Detailed Description

When you intend to execute a number of write operations to the database, group them while holding a [CoreDbOperationGroup](#). For some database systems (SQLite), keeping a transaction across write operations occurring in short time results in enormous speedup (800x). For system that do not need this optimization, this class is a no-op.

### 6.232.2 Constructor & Destructor Documentation

#### 6.232.2.1 CoreDbOperationGroup() [1/2]

```
Digikam::CoreDbOperationGroup::CoreDbOperationGroup ( )
```

Retrieve a [CoreDbAccess](#) object each time when constructing and destructing.

#### 6.232.2.2 CoreDbOperationGroup() [2/2]

```
Digikam::CoreDbOperationGroup::CoreDbOperationGroup (
    CoreDbAccess *const access ) [explicit]
```

Use an existing [CoreDbAccess](#) object, which must live as long as this object exists.

### 6.232.3 Member Function Documentation

#### 6.232.3.1 allowLift()

```
void Digikam::CoreDbOperationGroup::allowLift ( )
```

Allows to [lift](#)(). The transaction will be lifted if the time set by [setMaximumTime](#)() has expired.

### 6.232.3.2 lift()

```
void Digikam::CoreDbOperationGroup::lift ( )
```

This will - if a transaction is held - commit the transaction and acquire a new one. This may improve concurrent access.

### 6.232.3.3 resetTime()

```
void Digikam::CoreDbOperationGroup::resetTime ( )
```

Resets to 0 the time used by [allowLift\(\)](#)

```
CoreDbUrl Digikam::CoreDbUrl::fromDateRange (
    const QDate & startDate,
    const QDate & endDate,
    const DbEngineParameters & parameters = CoreDbAccess::parameters() ) [static]
```

Create a digikamdates:/ url for a specified time span which begin with the start date (inclusive) and ends before the end date (exclusive). To cover the whole year of 1984, you would pass 1/1/1984 and 1/1/1985.

### 6.236.2.14 fromFileUrl()

```
CoreDbUrl Digikam::CoreDbUrl::fromFileUrl (
    const QUrl & fileUrl,
    const QUrl & albumRoot,

    const DbEngineParameters & parameters = CoreDbAccess::parameters() ) [static]
```

This class shall facilitate the usage of digikamalbums:/, digikamtags:/, digikamdates:/ and digikamsearch: URLs. It provides functions to set and get the parameters stored in such a URL. (with the exception of the search parameters in a search URL, which are out of the scope of this class.) Create a digikamalbums:/ URL from a [file://](#) URL. The file URL can point to a file or a directory (an album in this case). The additional information stored in the URL need to be supplied as well:

- The album root in which the entity pointed to is stored. This is the left part of the file URL. (if the file is "/media/fotos/Summer 2007/001.jpg", the album root may be "/media/fotos")
- The parameters of the database that is referenced

### 6.236.2.15 fromTagIds()

### 6.236.2.16 isAlbumUrl()

```
bool Digikam::CoreDbUrl::isAlbumUrl ( ) const
```

These test for the protocol of this URL. The protocol string is of course available via protocol().

**6.236.2.25 tagIds()**

```
QList< int > Digikam::CoreDbUrl::tagIds ( ) const
```

Returns the tag ids of all tags in the tag path of this tag, the topmost tag in the hierarchy first.

## 6.237.1 Member Function Documentation

### 6.237.1.1 databaseChanged

```
void Digikam::CoreDbWatch::databaseChanged ( ) [signal]
```

Retrieve the [CoreDbWatch](#) object from [CoreDbAccess::databaseWatch\(\)](#). This does not describe a change of the contents of a table; rather, it signals that a new database has been loaded. That means all cached content has to be discarded.

### 6.237.1.2 imageChange

```

### 6.241.1 Constructor & Destructor Documentation

#### 6.241.1.1 CurvesContainer()

```
Digikam::CurvesContainer::CurvesContainer ( ) [default]
```

Provides a convenient storage for a curve. Initially, the values are empty. Call [initialize\(\)](#) before adjusting values manually.

## 6.241.2 Member Function Documentation

### 6.241.2.1 initialize()

```
void Digikam::CurvesContainer::initialize ( )
```

Fills the values with a linear curve suitable for type and sixteenBit parameters.

### 6.241.2.2 isEmpty()

```
bool Digikam::CurvesContainer::isEmpty ( ) const
```

An empty container is interpreted as a linear curve. A non-empty container can also be linear; test for `isLinear()` of the resulting [ImageCurves](#). Note: If an [ImageCurves](#) is linear, it will return an empty container.

### 6.241.2.3 isStoredLosslessly()

```
bool Digikam::CurvesContainer::isStoredLosslessly ( ) const
```

Serialize from and to [FilterAction](#). `isStoredLosslessly` returns false if the curve cannot be losslessly stored in XML because it would be too large (free 16 bit). It is then lossily compressed.

## 6.241.3 Member Data Documentation

### 6.241.3.1 curvesType

```
int Digikam::CurvesContainer::curvesType = ImageCurves::CURVE\_SMOOTH
```

Smooth : QPolygon have size of 18 points. Free : QPolygon have size of 255 or 65535 values.

### 6.248.1.1 setBlockUpdateSignalOnDrag()

```
void Digikam::DAbstractSliderSpinBox::setBlockUpdateSignalOnDrag (
    bool block )
```

If set to block, it informs inheriting classes that they shouldn't emit signals if the update comes from a mouse dragging the slider. Set this to true when dragging the slider and updates during the drag are not needed.

### 6.248.1.2 setInternalValue()

```
virtual void Digikam::DAbstractSliderSpinBox::setInternalValue (
    int value,
    bool blockUpdateSignal ) [protected], [pure virtual]
```

Sets the slider internal value. Inheriting classes should respect blockUpdateSignal so that, in specific cases, we have a performance improvement. See setIgnoreMouseMoveEvents.

Implemented in [Digikam::DSliderSpinBox](#), and [Digikam::DDoubleSliderSpinBox](#).

- enum { **Version** = 1 }

### Public Member Functions

- void [read](#) (const QByteArray &array, [Haar::SignatureData](#) &data)
- QByteArray **write** (const [Haar::SignatureData](#) &data)

### 6.255.1 Detailed Description

This class encapsulates the Haar signature in a QByteArray that can be stored as a BLOB in the database.

Reading and writing is done in a platform-independent manner, which induces a certain overhead, but which is necessary IMO.

### 6.255.2 Member Function Documentation

#### 6.255.2.1 read()

```
void Digikam::DatabaseBlob::read (
    const QByteArray & array,
    Haar::SignatureData & data )
```

Read the QByteArray into the [Haar::SignatureData](#).

### 6.260.1 Detailed Description

```
template<class T>
class Digikam::DatabaseFields::Hash< T >
```

This class provides a hash on all DatabaseFields enums, allowing to use the enum values as independent keys. You can use the class like a normal QHash with the value type defined by you, and as keys the members of the DatabaseFields enums. You can only use single enum members as keys, not or'ed numbers. You can use one custom enum, cast to DatabaseFields::CustomEnum, which can have at most 26 flag values ( $1 \ll 0$  to  $1 \ll 26$ ). Pass this as the optional second template parameter.

## 6.276.1 Detailed Description

A model for date based albums.

## 6.276.2 Constructor & Destructor Documentation

### 6.276.2.1 DateAlbumModel()

```
Digikam::DateAlbumModel::DateAlbumModel (  
    QObject *const parent = nullptr ) [explicit]
```

Constructor.

## Parameters

<i>parent</i>	the parent for Qt's parent child mechanism
---------------	--

## 6.276.3 Member Function Documentation

### 6.276.3.1 albumForId()

```
Album * Digikam::DateAlbumModel::albumForId (
    int id ) const [override], [protected], [virtual]
```

Implements [Digikam::AbstractCountingAlbumModel](#).

### 6.276.3.2 albumName()

```
QString Digikam::DateAlbumModel::albumName (
    Album * a ) const [override], [protected], [virtual]
```

Reimplemented from [Digikam::AbstractCountingAlbumModel](#).

### 6.276.3.3 decorationRoleData()

```
QVariant Digikam::DateAlbumModel::decorationRoleData (
    Album * a ) const [override], [protected], [virtual]
```

Reimplemented from [Digikam::AbstractAlbumModel](#).

### 6.276.3.4 monthIndexForDate()

```
QModelIndex Digikam::DateAlbumModel::monthIndexForDate (
    const QDate & date ) const
```

Finds an album index based on a date. The given date is therefore normalized to year-month-form. The day is ignored. This means the returned index always points to a month [DAlbum](#).

## Parameters

<i>date</i>	the date to search for (year and month)
-------------	---

## Returns

model index corresponding to the album with the given date or an empty index if not found

### 6.276.3.5 setPixmap()

```
void Digikam::DateAlbumModel::setPixmap (
```

```
const QPixmap & forYearAlbums,  
const QPixmap & forMonthAlbums )
```

Set pixmaps for the DecorationRole

### 6.276.3.6 sortRoleData()

```
QVariant Digikam::DateAlbumModel::sortRoleData (  
    Album * a ) const [override], [protected], [virtual]
```

Reimplemented from [Digikam::AbstractAlbumModel](#).

## 6.277.1 Member Function Documentation

### 6.277.1.1 doLoadState()

```
void Digikam::DateFolderView::doLoadState ( ) [override], [virtual]
```

Implement this hook method for state loading. Use [getConfigGroup\(\)](#) and [entryName\(\)](#) for the implementation.

Implements [Digikam::StateSavingObject](#).

### 6.277.1.2 doSaveState()

```
void Digikam::DateFolderView::doSaveState ( ) [override], [virtual]
```

Implement this hook method for state saving. Use [getConfigGroup\(\)](#) and [entryName\(\)](#) for the implementation.

Implements [Digikam::StateSavingObject](#).

### 6.277.1.3 setConfigGroup()

```
void Digikam::DateFolderView::setConfigGroup (
    const KConfigGroup & group ) [override], [virtual]
```

Sets a dedicated config group that will be used to store and reload the state from. If this method is not called, a group based on the object name is used.

You can re-implement this method to pass the group set here to child objects. Don't forget to call this method in your implementation.

#### Parameters

<i>group</i>	config group to use for state saving and restoring
--------------	--

Reimplemented from [Digikam::StateSavingObject](#).

## 6.301.2 Constructor & Destructor Documentation

### 6.301.2.1 DbEngineParameters()

```
Digikam::DbEngineParameters::DbEngineParameters (
    const QUrl & url ) [explicit]
```

```

Return the default Mysql server command name (Internal server only).

### 6.301.3.4 defaultMysqlUpgradeCmd()

```
QString Digikam::DbEngineParameters::defaultMysqlUpgradeCmd ( ) [static]
```

Return the default Mysql upgrade command name (Internal server only).

### 6.301.3.5 defaultParameters()

```
DbEngineParameters Digikam::DbEngineParameters::defaultParameters (

Return a set of default parameters for the given type. For Mysql, it return internal server configuration.

### 6.301.3.6 faceParameters()

```
DbEngineParameters Digikam::DbEngineParameters::faceParameters ( ) const
```

Replaces databaseName with databaseNameFace.

### 6.301.3.7 getCoreDatabaseNameOrDir()

```
QString Digikam::DbEngineParameters::getCoreDatabaseNameOrDir ( ) const
```

#### Note

In case of SQLite, the database name typically is a file. For non-SQLite, this simply handle the database name.

### 6.301.3.8 hash()

```
QByteArray Digikam::DbEngineParameters::hash ( ) const
```

Creates a unique hash of the values stored in this object.

### 6.301.3.9 isValid()

```
bool Digikam::DbEngineParameters::isValid ( ) const
```

Performs basic checks that the parameters are not empty and have the information required for the databaseType.

### 6.301.3.10 parametersForSQLite()

```
DbEngineParameters Digikam::DbEngineParameters::parametersForSQLite (
    const QString & databaseFile ) [static]
```

Convenience methods to create a [DbEngineParameters](#) object for an SQLITE database specified by the local file path.

### 6.301.3.11 readFromConfig()

```
void Digikam::DbEngineParameters::readFromConfig (
    const QString & configGroup = QString() )
```

Read and write parameters from config. You can specify the group, or use the default value.

### 6.301.3.12 serverPrivatePath()

```
QString Digikam::DbEngineParameters::serverPrivatePath ( ) [static]
```

Return the hidden path from home directory to store private data used by internal Mysql server.

### 6.301.3.13 setCoreDatabasePath()

```
void Digikam::DbEngineParameters::setCoreDatabasePath (
    const QString & folderOrFileOrName )
```

Use these methods if you set a file or a folder.

### 6.301.3.14 setInternalServerPath()

```
void Digikam::DbEngineParameters::setInternalServerPath (
    const QString & path )
```

For Mysql internal server: manage the database path to store database files.

### 6.301.3.15 similarityParameters()

```
DbEngineParameters Digikam::DbEngineParameters::similarityParameters ( ) const
```

Replaces databaseName with databaseNameFace.

### 6.301.3.16 SQLiteDatabaseType()

```
QString Digikam::DbEngineParameters::SQLiteDatabaseType ( ) [static]
```

Returns the databaseType designating the said database. If you have a [DbEngineParameters](#) object already, you can use `isSQLite()` as well. These strings are identical to the driver identifiers in the Qt SQL module.

### 6.301.3.17 thumbnailParameters()

```
DbEngineParameters Digikam::DbEngineParameters::thumbnailParameters ( ) const
```

Replaces databaseName with databaseNameThumbnails.

## 6.301.4 Member Data Documentation

### 6.301.4.1 internalServerMysqlInitCmd

```
QString Digikam::DbEngineParameters::internalServerMysqlInitCmd

### 6.322.1 Detailed Description

This class lets you categorize a view. It is meant to be used along with [DCategorizedView](#) class.

In general terms all you need to do is to reimplement [subSortLessThan\(\)](#) and [compareCategories\(\)](#) methods. In order to make categorization work, you need to also call [setCategorizedModel\(\)](#) class to enable it, since the categorization is disabled by default.

### 6.322.2 Member Enumeration Documentation

#### 6.322.2.1 AdditionalRoles

```
enum Digikam::DCategorizedSortFilterProxyModel::AdditionalRoles
```

#### Enumerator

CategoryDisplayRole	<p><b>Note</b></p> <p>use <code>printf "0x%08X\n" ((\$RANDOM*\$RANDOM))</code> to define additional roles. This role is used for asking the category to a given index</p>
CategorySortRole	<p>This role is used for sorting categories. You can return a string or a long long value. Strings will be sorted alphabetically while long long will be sorted by their value. Please note that this value won't be shown on the view, is only for sorting purposes. What will be shown as "Category" on the view will be asked with the role <a href="#">CategoryDisplayRole</a>.</p>

## 6.322.3 Member Function Documentation

### 6.322.3.1 compareCategories()

```
int Digikam::DCategorizedSortFilterProxyModel::compareCategories (
    const QModelIndex & left,
    const QModelIndex & right ) const [protected], [virtual]
```

This method compares the category of the `left` index with the category of the `right` index.

Internally and if not reimplemented, this method will ask for `left` and `right` models for role `CategorySortRole`. In order to correctly sort categories, the `data()` method of the model should return a `qulonglong` (or numeric) value, or a `QString` object. `QString` objects will be sorted with `QString::localeAwareCompare` if `sortCategoriesByNaturalComparison()` is true.

#### Note

Please have present that: `QString(QChar(QChar::ObjectReplacementCharacter)) > QString(QChar(QChar::ReplacementCharacter)) > [ all possible strings ] > QString();`

This means that `QString()` will be sorted the first one, while `QString(QChar(QChar::ObjectReplacementCharacter))` and `QString(QChar(QChar::ReplacementCharacter))` will be sorted in last position.

#### Warning

Please note that `data()` method of the model should return always information of the same type. If you return a `QString` for an index, you should return always `QStrings` for all indexes for role `CategorySortRole` in order to correctly sort categories. You can't mix by returning a `QString` for one index, and a `qulonglong` for other.

#### Note

If you need a more complex layout, you will have to reimplement this method.

#### Returns

A negative value if the category of `left` should be placed before the category of `right`. 0 if `left` and `right` are on the same category, and a positive value if the category of `left` should be placed after the category of `right`.

Reimplemented in [Digikam::ItemFilterModel](#), [ShowFoto::ShowfotoFilterModel](#), and [Digikam::ImportFilterModel](#).

### 6.322.3.2 isCategorizedModel()

```
bool Digikam::DCategorizedSortFilterProxyModel::isCategorizedModel ( ) const
```

#### Returns

whether the model is categorized or not. Disabled by default.

### 6.322.3.3 lessThan()

```
bool Digikam::DCategorizedSortFilterProxyModel::lessThan (
    const QModelIndex & left,
    const QModelIndex & right ) const [override], [protected]
```

Overridden from `QSortFilterProxyModel`. If you are subclassing [DCategorizedSortFilterProxyModel](#), you will probably not need to reimplement this method.

It calls [compareCategories\(\)](#) to sort by category. If the both items are in the same category (i.e. `compareCategories` returns 0), then `subSortLessThan` is called.

#### Returns

Returns true if the item `left` is less than the item `right` when sorting.

#### Warning

You usually won't need to reimplement this method when subclassing from [DCategorizedSortFilterProxyModel](#).

### 6.322.3.4 setCategorizedModel()

```
void Digikam::DCategorizedSortFilterProxyModel::setCategorizedModel (
    bool categorizedModel )
```

Enables or disables the categorization feature.

#### Parameters

<i>categorizedModel</i>	whether to enable or disable the categorization feature.
-------------------------	--

### 6.322.3.5 setSortCategoriesByNaturalComparison()

```
void Digikam::DCategorizedSortFilterProxyModel::setSortCategoriesByNaturalComparison (
    bool sortCategoriesByNaturalComparison )
```

Set if the sorting using `CategorySortRole` will use a natural comparison in the case that strings were returned. If enabled, `QCollator` will be used for sorting.

#### Parameters

<i>sortCategoriesByNaturalComparison</i>	whether to sort using a natural comparison or not.
--	--

### 6.322.3.6 sort()

```
void Digikam::DCategorizedSortFilterProxyModel::sort (
    int column,
    Qt::SortOrder order = Qt::AscendingOrder ) [override]
```

Overridden from `QSortFilterProxyModel`. Sorts the source model using `column` for the given `order`.

### 6.322.3.7 `sortCategoriesByNaturalComparison()`

```
bool Digikam::DCategorizedSortFilterProxyModel::sortCategoriesByNaturalComparison ( ) const
```

#### Returns

whether it is being used a natural comparison for sorting. Enabled by default.

### 6.322.3.8 `sortColumn()`

```
int Digikam::DCategorizedSortFilterProxyModel::sortColumn ( ) const
```

#### Returns

the column being used for sorting.

### 6.322.3.9 `sortOrder()`

```
Qt::SortOrder Digikam::DCategorizedSortFilterProxyModel::sortOrder ( ) const
```

#### Returns

the sort order being used for sorting.

### 6.322.3.10 `subSortLessThan()`

```
bool Digikam::DCategorizedSortFilterProxyModel::subSortLessThan (
    const QModelIndex & left,
    const QModelIndex & right ) const [protected], [virtual]
```

This method has a similar purpose as [lessThan\(\)](#) has on `QSortFilterProxyModel`. It is used for sorting items that are in the same category.

#### Returns

Returns true if the item `left` is less than the item `right` when sorting.

Reimplemented in [Digikam::ItemFilterModel](#), [ShowFoto::ShowfotoFilterModel](#), and [Digikam::ImportFilterModel](#).

### 6.327.1 Detailed Description

The category drawing is performed by this class. It also gives information about the category height and margins.

### 6.327.2 Constructor & Destructor Documentation

#### 6.327.2.1 DCategoryDrawer()

```
Digikam::DCategoryDrawer::DCategoryDrawer (
    DategorizedView *const view ) [explicit]

```
void Digikam::DCategoryDrawer::actionRequested (
    int action,
    const QModelIndex & index ) [signal]
```

Emit this signal on your subclass implementation to notify that something happened. Usually this will be triggered when you have received an event, and its position matched some "hot spot".

You give this action the integer you want, and having connected this signal to your code, the connected slot can perform the needed changes (view, model, selection model, delegate...)

## 6.329.1 Constructor & Destructor Documentation

### 6.329.1.1 DColor() [1/4]

```
Digikam::DColor::DColor ( ) [default]
```

Initialize with default value, fully transparent eight bit black

### 6.329.1.2 DColor() [2/4]

```
Digikam::DColor::DColor (
    uchar * data,
    bool sixteenBit = false ) [inline], [explicit]
```

Read value from data. Equivalent to [setColor\(\)](#)

### 6.329.1.3 DColor() [3/4]

```
Digikam::DColor::DColor (
    int red,
    int green,
    int blue,
    int alpha,
    bool sixteenBit ) [inline]
```

Initialize with given RGBA values

### 6.329.1.4 DColor() [4/4]

```
Digikam::DColor::DColor (
    const QColor & color,
    bool sixteenBit = false ) [explicit]
```

Read values from QColor, convert to sixteenBit if sixteenBit is true

## 6.329.2 Member Function Documentation

### 6.329.2.1 blendZero()

```
void Digikam::DColor::blendZero ( ) [inline]
```

Inline alpha blending helper functions. These functions are used by [DColorComposer](#). Look at that code to learn how to use them for composition if you want to use them in optimized code.

### 6.329.2.2 convertToSixteenBit()

```
void Digikam::DColor::convertToSixteenBit ( )
```

Convert the color values of this color to and from sixteen bit and set the sixteenBit value accordingly

### 6.329.2.3 getHSL()

```
void Digikam::DColor::getHSL (
    int *const h,
    int *const s,
    int *const l ) const
```

Return the current RGB color values of this color in the HSL color space. Alpha is ignored for the conversion.

### 6.329.2.4 getYCbCr()

```
void Digikam::DColor::getYCbCr (
    double *const y,
    double *const cb,
    double *const cr ) const
```

Return the current RGB color values of this color in the YCrCb color space. Alpha is ignored for the conversion.

### 6.329.2.5 premultiply()

```
void Digikam::DColor::premultiply ( ) [inline]
```

Premultiply and demultiply this color. [DImg](#) stores the color non-premultiplied. Inline methods.

### 6.329.2.6 setColor()

```
void Digikam::DColor::setColor (
    uchar *const data,
    bool sixteenBit = false ) [inline]
```

Read color values as RGBA from the given memory location. If sixteenBit is false, 4 bytes are read. If sixteenBit is true, 8 bytes are read. Inline method.

These methods are used in quite a few image effects, typically in loops iterating the data. Providing them as inline methods allows the compiler to optimize better.

### 6.329.2.7 setHSL()

```
void Digikam::DColor::setHSL (
    int h,
    int s,
    int l,
    bool sixteenBit )
```

Set the RGB color values of this color to the given HSL values converted to RGB. Alpha is set to be fully opaque. sixteenBit determines both how the HSL values are interpreted and the sixteenBit value of this color after this operation.

### 6.329.2.8 setPixel()

```
void Digikam::DColor::setPixel (
    uchar *const data ) const [inline]
```

Write the values of this color to the given memory location. If sixteenBit is false, 4 bytes are written. If sixteenBit is true, 8 bytes are written. Inline method.

### 6.329.2.9 setYCbCr()

```
void Digikam::DColor::setYCbCr (
    double y,
    double cb,
    double cr,
    bool sixteenBit )
```

Set the RGB color values of this color to the given YCrCb values converted to RGB. Alpha is set to be fully opaque. sixteenBit determines both how the YCrCb values are interpreted and the sixteenBit value of this color after this operation.

## 6.330.1 Member Enumeration Documentation

### 6.330.1.1 CompositingOperation

```
enum Digikam::DColorComposer::CompositingOperation
```

The available rules to combine src and destination color.

For the Porter-Duff rules, the formula is  $\text{component} = (\text{source} * \text{fs} + \text{destination} * \text{fd})$  where fs, fd according to the following table with sa = source alpha, da = destination alpha:

None fs: sa fd: 1.0-sa Clear fs: 0.0 fd: 0.0 Src fs: 1.0 fd: 0.0 Src Over fs: 1.0 fd: 1.0-sa Dst Over fs: 1.0-da fd: 1.0 Src In fs: da fd: 0.0 Dst In fs: 0.0 fd: sa Src Out fs: 1.0-da fd: 0.0 Dst Out fs: 0.0 fd: 1.0-sa

Src Atop fs: da fd: 1.0-sa Dst Atop fs: 1.0-da fd: sa Xor fs: 1.0-da fd: 1.0-sa

None is the default, classical blending mode, a "Src over" simplification: Blend non-premultiplied RGBA data "src over" a fully opaque background. Src is the painter's algorithm. All other operations require premultiplied colors. The documentation of `java.awt.AlphaComposite` (Java 1.5) provides a good introduction and documentation on Porter Duff.

## 6.330.2 Member Function Documentation

### 6.330.2.1 compose() [1/2]

```
virtual void Digikam::DColorComposer::compose (
    DColor & dest,
    DColor & src ) [pure virtual]
```

Carry out the actual composition process. Src and Dest are composed and the result is written to dest. No pre-/demultiplication is done by this method, use the other overloaded methods, which call this method, if you need pre- or demultiplication (you need it if any of the colors are read from or written to a [DImg](#)).

If you just pass the object to a [DImg](#) method, you do not need to call this. Call this function if you want to compose two colors. Implement this function if you create a custom [DColorComposer](#).

The bit depth of source and destination color must be identical.

### 6.330.2.2 compose() [2/2]

```
void Digikam::DColorComposer::compose (
    DColor & dest,
    DColor & src,
    DColorComposer::MultiplicationFlags multiplicationFlags ) [virtual]
```

Compose the two colors by calling `compose(dest, src)`. Pre- and demultiplication operations are done as specified. For PorterDuff operations except PorterDuffNone, you need

- PremultiplySrc if src is not premultiplied (read from a [DImg](#))
- PremultiplyDst if dst is not premultiplied (read from a [DImg](#))
- DemultiplyDst if dst will be written to non-premultiplied data (a [DImg](#))

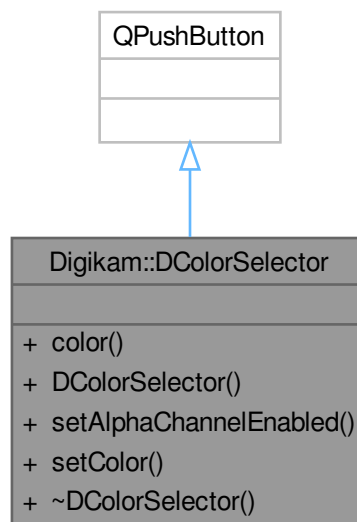

### 6.330.2.3 getComposer()

```
DColorComposer * Digikam::DColorComposer::getComposer (
    DColorComposer::CompositingOperation rule ) [static]
```

Retrieve a [DColorComposer](#) object for one of the predefined rules. The object needs to be deleted by the caller.

## 6.334.1 Detailed Description

This class provides a dialog base class which handles multiple pages and allows the user to switch between these pages in different ways.

Currently, `Auto`, `Plain`, `List`, `Tree` and `Tabbed` face types are available (

See also

[DConfigDlgView](#)).

## 6.334.2 Member Enumeration Documentation

### 6.334.2.1 FaceType

enum `Digikam::DConfigDlg::FaceType`

- `Auto` - A dialog with a face based on the structure of the available pages. If only a single page is added, the dialog behaves like in `Plain` mode, with multiple pages without sub pages it behaves like in `List` mode and like in `Tree` mode otherwise.
- `Plain` - A normal dialog.
- `List` - A dialog with an icon list on the left side and a representation of the contents on the right side.
- `Tree` - A dialog with a tree on the left side and a representation of the contents on the right side.
- `Tabbed` - A dialog with a tab bar above the representation of the contents.

## 6.335.1 Detailed Description

The [DConfigDlgMngr](#) class provides a means of automatically retrieving, saving and resetting basic settings. It also can emit signals when settings have been changed (settings were saved) or modified (the user changes a checkbox from on to off).

The object names of the widgets to be managed have to correspond to the names of the configuration entries in the KConfigSkeleton object plus an additional "kcfg\_" prefix. For example a widget with the object name "kcfg\_↔ MyOption" would be associated to the configuration entry "MyOption".

The widget classes of Qt are supported out of the box.

Custom widget classes are supported if they have a Q\_PROPERTY defined for the property representing the value edited by the widget. By default the property is used for which "USER true" is set. For using another property, see below.

## 6.335.2 Constructor & Destructor Documentation

### 6.335.2.1 DConfigDlgMngr()

```

Destructor.

**6.335.3 Member Function Documentation****6.335.3.1 addWidget()**

```
void Digikam::DConfigDlgMngr::addWidget (
    QWidget *const widget )
```

```

Retrieve the map between widgets class names and signals that are listened to detect changes in the configuration values.

**6.335.3.3 getCustomProperty()**

```
QByteArray Digikam::DConfigDlgMngr::getCustomProperty (
    const QWidget * widget ) const [protected]
```

Find the property to use for a widget by querying the "kcfg\_property" property of the widget. Like a widget can use a property other than the USER property.

**6.335.3.4 getCustomPropertyChangedSignal()**

```
QByteArray Digikam::DConfigDlgMngr::getCustomPropertyChangedSignal (
    const QWidget * widget ) const [protected]
```

Find the changed signal of the property to use for a widget by querying the "kcfg\_propertyNotify" property of the widget. Like a widget can use a property change signal other than the one for USER property, if there even is one.

**6.335.3.5 getUserProperty()**

```
QByteArray Digikam::DConfigDlgMngr::getUserProperty (
    const QWidget * widget ) const [protected]
```

Finds the USER property name using Qt's MetaProperty system, and caches it in the property map (the cache could be retrieved by [propertyMap\(\)](#) ).

**6.335.3.6 getUserPropertyChangedSignal()**

```
QByteArray Digikam::DConfigDlgMngr::getUserPropertyChangedSignal (
    const QWidget * widget ) const [protected]
```

Finds the changed signal of the USER property using Qt's MetaProperty system.

**6.335.3.7 hasChanged()**

```
bool Digikam::DConfigDlgMngr::hasChanged ( ) const
```

Returns whether the current state of the known widgets are different from the state in the config object.

**6.335.3.8 init()**

```
void Digikam::DConfigDlgMngr::init (
    bool trackChanges ) [protected]
```

**Parameters**

<i>trackChanges</i>	- If any changes by the widgets should be tracked set true. This causes the emitting the modified() signal when something changes.
---------------------	--

**6.335.3.9 initMaps()**

```
void Digikam::DConfigDlgMngr::initMaps ( ) [static], [protected]
```

Initializes the property maps

**6.335.3.10 isDefault()**

```
bool Digikam::DConfigDlgMngr::isDefault ( ) const
```

Returns whether the current state of the known widgets are the same as the default state in the config object.

**6.335.3.11 parseChildren()**

```
bool Digikam::DConfigDlgMngr::parseChildren (
    const QWidget * widget,
    bool trackChanges ) [protected]
```

Recursive function that finds all known children. Goes through the children of widget and if any are known and not being ignored, stores them in currentGroup. Also checks if the widget should be disabled because it is set immutable.

**Parameters**

<i>widget</i>	- Parent of the children to look at.
<i>trackChanges</i>	- If true then tracks any changes to the children of widget that are known.

**Returns**

bool - If a widget was set to something other than its default.

**6.335.3.12 property()**

```
QVariant Digikam::DConfigDlgMngr::property (
    QWidget * w ) const [protected]
```

Retrieve a property

**6.335.3.13 propertyMap()**

```
QHash< QString, QByteArray > * Digikam::DConfigDlgMngr::propertyMap ( ) [static]
```

Retrieve the map between widgets class names and the USER properties used for the configuration values.

**6.335.3.14 setProperty()**

```
void Digikam::DConfigDlgMngr::setProperty (
    QWidget * w,
    const QVariant & v ) [protected]
```

Set a property

**6.335.3.15 settingsChanged [1/2]**

```
void Digikam::DConfigDlgMngr::settingsChanged ( ) [signal]
```

One or more of the settings have been saved (such as when the user clicks on the Apply button). This is only emitted by [updateSettings\(\)](#) whenever one or more setting were changed and consequently saved.

**6.335.3.16 settingsChanged [2/2]**

```
void Digikam::DConfigDlgMngr::settingsChanged (
    QWidget * widget ) [signal]
```

One or more of the settings have been changed.

## Parameters

<i>widget</i>	- The widget group (pass in via <a href="#">addWidget()</a> ) that contains the one or more modified setting.
---------------	---

## See also

[settingsChanged\(\)](#)**6.335.3.17 setupWidget()**

```

If [retrieveSettings\(\)](#) was told to track changes then if any known setting was changed this signal will be emitted. Note that a settings can be modified several times and might go back to the original saved state. [hasChanged\(\)](#) will tell you if anything has actually changed from the saved values.

## 6.336 Digikam::DConfigDlgModel Class Reference

A base class for a model used by [DConfigDlgView](#).

Inheritance diagram for Digikam::DConfigDlgModel:

### Public Types

Additional roles that `DConfigDlgView` uses.

Enumerator

<code>HeaderRole</code>	A string to be rendered as page header.
<code>WidgetRole</code>	A pointer to the page widget. This is the widget that is shown when the item is selected.

## 6.339.1 Detailed Description

This class provides a widget often used for [DConfigDlg](#) titles.

[DConfigDlgTitle](#) uses the general application font at 1.4 times its size to style the text.

[DConfigDlgTitle](#) is very simple to use. You can either use its default text (and pixmap) properties or display your own widgets in the title widget.

### 6.341.2 Member Enumeration Documentation

#### 6.341.2.1 FaceType

```
enum Digikam::DConfigDlgView::FaceType
```

This enum is used to decide which type of navigation view shall be used in the page view.

- `Auto` - Depending on the number of pages in the model, the `Plain` (one page), the `List` (several pages) or the `Tree` face (nested pages) will be used. This is the default face type.
- `Plain` - No navigation view will be visible and only the first page of the model will be shown.
- `List` - An icon list is used as navigation view.
- `Tree` - A tree list is used as navigation view.
- `Tabbed` - A tab widget is used as navigation view.

## 6.341.3 Constructor & Destructor Documentation

### 6.341.3.1 DConfigDlgView()

```
Digikam::DConfigDlgView::DConfigDlgView (
    QWidget *const parent = nullptr ) [explicit]

## Parameters

<i>delegate</i>	which can be used customize the page view.
-----------------	--

**6.341.4.11 setModel()**

```
void Digikam::DConfigDlgView::setModel (
    QAbstractItemModel * model )

```

Creates a new page widget item.

## Parameters

<i>widget</i>	The widget that is shown as page in the <a href="#">DConfigDlgWdg</a> .
---------------	---

Hide the widget, otherwise when the widget has this [DConfigDlgView](#) as parent the widget is shown outside the `QStackedWidget` if the page was not selected ( and reparented ) yet.

**6.344.2.2 DConfigDlgWdgItem()** [2/2]

```
Digikam::DConfigDlgWdgItem::DConfigDlgWdgItem (
    QWidget *const widget,

## 6.349.1 Detailed Description

A date editing widget that consists of an editable combo box. The combo box contains the date in text form, and clicking the combo box arrow will display a 'popup' style date picker.

This widget also supports advanced features like allowing the user to type in the day name to get the date. The following keywords are supported (in the native language): tomorrow, yesterday, today, Monday, Tuesday, Wednesday, Thursday, Friday, Saturday, Sunday.

## 6.349.2 Member Function Documentation

### 6.349.2.1 assignDate()

```
bool Digikam::DDateEdit::assignDate (
    const QDate & date ) [protected], [virtual]
```

Sets the date, without altering the display. This method is used internally to set the widget's date value. As a virtual method, it allows derived classes to perform additional validation on the date value before it is set. Derived classes should return true if `QDate::isValid(date)` returns false.

#### Parameters

<i>date</i>	The new date to set.
-------------	----------------------

#### Returns

True if the date was set, false if it was considered invalid and remains unchanged.

### 6.349.2.2 date()

```
QDate Digikam::DDateEdit::date ( ) const
```

#### Returns

The date entered. This date could be invalid, you have to check validity yourself.

### 6.349.2.3 dateChanged

```
void Digikam::DDateEdit::dateChanged (
    const QDate & date ) [signal]
```

This signal is emitted whenever the user modifies the date. The passed date can be invalid.

### 6.349.2.4 isReadOnly()

```
bool Digikam::DDateEdit::isReadOnly ( ) const
```

#### Returns

True if the widget is read-only, false if read-write.

### 6.349.2.5 setDate

```
void Digikam::DDateEdit::setDate (
    const QDate & date ) [slot]
```

Sets the date.

#### Parameters

<i>date</i>	The new date to display. This date must be valid or it will not be set
-------------	--

### 6.349.2.6 setReadOnly()

```
void Digikam::DDateEdit::setReadOnly (
    bool readOnly )
```

Sets whether the widget is read-only for the user. If read-only, the date picker pop-up is inactive, and the displayed date cannot be edited.

#### Parameters

<i>readOnly</i>	True to set the widget read-only, false to set it read-write.
-----------------	---

### 6.349.2.7 setupKeywords()

```
void Digikam::DDateEdit::setupKeywords ( ) [protected]
```

Fills the keyword map. Re-implement it if you want additional keywords.

### 6.350.1 Detailed Description

### 6.350.2 Constructor & Destructor Documentation

#### 6.350.2.1 DDatePicker() [1/2]

```
Digikam::DDatePicker::DDatePicker (
    QWidget *const parent = nullptr ) [explicit]
```

The constructor. The current date will be displayed initially.

#### 6.350.2.2 DDatePicker() [2/2]

```
Digikam::DDatePicker::DDatePicker (
    const QDate & dt,
    QWidget *const parent = nullptr ) [explicit]
```

The constructor. The given date will be displayed initially.

#### 6.350.2.3 ~DDatePicker()

```
Digikam::DDatePicker::~DDatePicker ( ) [override]
```

The destructor.

### 6.350.3 Member Function Documentation

#### 6.350.3.1 date()

```
const QDate & Digikam::DDatePicker::date ( ) const
```

#### Returns

the selected date.

### 6.350.3.2 dateChanged

```
void Digikam::DDatePicker::dateChanged (
    const QDate & date ) [signal]
```

This signal is emitted each time the selected date is changed. Usually, this does not mean that the date has been entered, since the date also changes, for example, when another month is selected.

See also

[dateSelected](#)

### 6.350.3.3 dateEntered

```
void Digikam::DDatePicker::dateEntered (
    const QDate & date ) [signal]
```

This signal is emitted when enter is pressed and a VALID date has been entered before into the line edit. Connect to both [dateEntered\(\)](#) and [dateSelected\(\)](#) to receive all events where the user really enters a date.

### 6.350.3.4 dateSelected

```
void Digikam::DDatePicker::dateSelected (
    const QDate & date ) [signal]
```

This signal is emitted each time a day has been selected by clicking on the table (hitting a day in the current month). It has the same meaning as [dateSelected\(\)](#) in older versions of [DDatePicker](#).

### 6.350.3.5 dateTable()

```
DDateTable * Digikam::DDatePicker::dateTable ( ) const
```

Returns

the [DDateTable](#) widget child of this [DDatePicker](#) widget.

### 6.350.3.6 fontSize()

```
int Digikam::DDatePicker::fontSize ( ) const
```

Returns the font size of the widget elements.

### 6.350.3.7 hasCloseButton()

```
bool Digikam::DDatePicker::hasCloseButton ( ) const
```

#### Returns

true if a [DDatePicker](#) shows a close-button.

#### See also

[setCloseButton](#)

### 6.350.3.8 setCloseButton()

```
void Digikam::DDatePicker::setCloseButton (
    bool enable )
```

By calling this method with `enable = true`, [DDatePicker](#) will show a little close-button in the upper button-row. Clicking the close-button will cause the [DDatePicker](#)'s `topLevelWidget()`'s `close()` method being called. This is mostly useful for toplevel datepickers without a window manager decoration.

#### See also

[hasCloseButton](#)

### 6.350.3.9 setDate()

```
bool Digikam::DDatePicker::setDate (
    const QDate & date )
```

Sets the date.

#### Returns

`false` and does not change anything if the date given is invalid.

### 6.350.3.10 setFontSize()

```
void Digikam::DDatePicker::setFontSize (
    int s )
```

Sets the font size of the widgets elements.

### 6.350.3.11 sizeHint()

```
QSize Digikam::DDatePicker::sizeHint ( ) const [override]
```

The size hint for date pickers. The size hint recommends the minimum size of the widget so that all elements may be placed without clipping. This sometimes looks ugly, so when using the size hint, try adding 28 to each of the reported numbers of pixels.

### 6.350.3.12 tableClicked

```
void Digikam::DDatePicker::tableClicked ( ) [signal]
```

This signal is emitted when the day has been selected by clicking on it in the table.

NOTE: every year can have a different number of weeks it could be that we had 53,1..52 and now 1..53 which is the same number but different so always fill with new values We show all week numbers for all weeks between first day of year to last day of year This of course can be a list like 53,1,2..52

### 6.352.1 Detailed Description

This menu helps the user to select a date quickly. It offers various ways of selecting, e.g. with a [DDatePicker](#) or with words like "Tomorrow".

The available items are:

- NoDate: A menu-item with "No Date". If chosen, the datepicker will emit a null QDate.
- DatePicker: Show a DDatePicker-widget.
- Words: Show items like "Today", "Tomorrow" or "Next Week".

When supplying multiple items, separate each item with a bitwise OR.

### 6.352.2 Constructor & Destructor Documentation

### 6.353.1 Detailed Description

This is a support class for the [DDatePicker](#) class. It just draws the calendar table without titles, but could theoretically be used as a standalone.

When a date is selected by the user, it emits a signal: `dateSelected(QDate)`

## 6.353.2 Member Function Documentation

### 6.353.2.1 aboutToShowContextMenu

```
void Digikam::DDateTable::aboutToShowContextMenu (
    QMenu * menu,
    const QDate & dt ) [signal]
```

A popup menu for a given date is about to be shown (as when the user right clicks on that date and the popup menu is enabled). Connect the slot where you fill the menu to this signal.

### 6.353.2.2 date()

```
const QDate & Digikam::DDateTable::date ( ) const
```

#### Returns

the selected date.

### 6.353.2.3 dateChanged [1/2]

```
void Digikam::DDateTable::dateChanged (
    const QDate & cur,
    const QDate & old ) [signal]
```

This function behaves essentially like the one above. The selected date changed.

#### Parameters

<i>cur</i>	The current date
<i>old</i>	The date before the date was changed

### 6.353.2.4 dateChanged [2/2]

```
void Digikam::DDateTable::dateChanged (
    const QDate & date ) [signal]
```

The selected date changed.

### 6.353.2.5 dateFromPos()

```
QDate Digikam::DDateTable::dateFromPos (
    int pos ) [protected], [virtual]
```

calculate the date that is displayed at a given cell in the matrix. *pos* is the 0-based index in the matrix. Inverse function to `posFromDate()`.

### 6.353.2.6 event()

```
bool Digikam::DDateTable::event (
    QEvent * e ) [override], [protected]
```

Cell highlight on mouse hovering

### 6.353.2.7 mousePressEvent()

```
void Digikam::DDateTable::mousePressEvent (
    QMouseEvent * e ) [override], [protected]
```

React on mouse clicks that select a date.

### 6.353.2.8 popupMenuEnabled()

```
bool Digikam::DDateTable::popupMenuEnabled ( ) const
```

Returns if the popup menu is enabled or not

### 6.353.2.9 posFromDate()

```
int Digikam::DDateTable::posFromDate (
    const QDate & dt ) [protected], [virtual]
```

calculate the position of the cell in the matrix for the given date. The result is the 0-based index.

### 6.353.2.10 setCustomDatePainting()

```
void Digikam::DDateTable::setCustomDatePainting (
    const QDate & date,
    const QColor & fgColor,
    BackgroundMode bgMode = NoBgMode,
    const QColor & bgColor = QColor() )
```

Makes a given date be painted with a given foregroundColor, and background (a rectangle, or a circle/ellipse) in a given color.

### 6.353.2.11 setDate()

```
bool Digikam::DDateTable::setDate (
    const QDate & date )
```

Select and display this date.

**6.353.2.12 setFontSize()**

```
void Digikam::DDateTable::setFontSize (
    int size )
```

Set the font size of the date table.

**6.353.2.13 setPopupMenuEnabled()**

```
void Digikam::DDateTable::setPopupMenuEnabled (
    bool enable )
```

Enables a popup menu when right clicking on a date.

When it's enabled, this object emits a `aboutToShowContextMenu` signal where you can fill in the menu items.

**6.353.2.14 sizeHint()**

```
QSize Digikam::DDateTable::sizeHint ( ) const [override]
```

Returns a recommended size for the widget. To save some time, the size of the largest used cell content is calculated in each `paintCell()` call, since all calculations have to be done there anyway. The size is stored in `maxCell`. The `sizeHint()` simply returns a multiple of `maxCell`.

**6.353.2.15 tableClicked**

```
void Digikam::DDateTable::tableClicked ( ) [signal]
```

A date has been selected by clicking on the table.

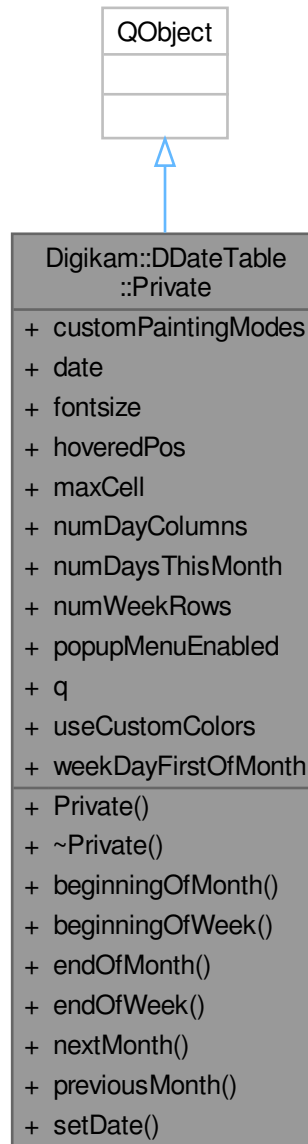

**6.353.2.16 unsetCustomDatePainting()**

```
void Digikam::DDateTable::unsetCustomDatePainting (
    const QDate & dt )
```

Unsets the custom painting of a date so that the date is painted as usual.

### 6.362.1 Member Function Documentation

#### 6.362.1.1 `baseName()`

```
QString Digikam::DefaultVersionNamingScheme::baseName (
    const QString & path,
    const QString & filename,
    QVariant * counter,
    QVariant * intermediateCounter ) [override], [virtual]
```

Analyzes the given file name. Returns the basename in the sense of stripping the file name of all added version information: A scheme that appends a number, like "MyFile-1.jpg", shall return "MyFile". Path is the directory, filename the file name, so path + filename is the file path. If counter is given, and the given file name has a version number, write it to counter. If intermediateCounter is given, and the given file name has an intermediate counter number, write it to counter. If not available, do not touch the given counters. See [initialCounter\(\)](#) for the valid counter formats.

Implements [Digikam::VersionNamingScheme](#).

#### 6.362.1.2 `directory()`

```
QString Digikam::DefaultVersionNamingScheme::directory (
    const QString & path,
    const QString & filename ) [override], [virtual]
```

For a loaded file in directory path and with file name filename, returns the directory in which a new version (a new intermediate version, resp.) shall be stored.

Implements [Digikam::VersionNamingScheme](#).

#### 6.362.1.3 `incrementedCounter()`

```
QVariant Digikam::DefaultVersionNamingScheme::incrementedCounter (
    const QVariant & counter ) [override], [virtual]
```

Returns the given counter "incremented", that is, changed in a steady, repeatable fashion. You shall never return the given counter.

Implements [Digikam::VersionNamingScheme](#).

#### 6.362.1.4 `initialCounter()`

```
QVariant Digikam::DefaultVersionNamingScheme::initialCounter ( ) [override], [virtual]
```

Returns an initial counter value for version and intermediate number counters. There are two places where you shall generate counters You will receive the given QVariant in [incrementedCounter\(\)](#), [versionFileName\(\)](#) and [baseName\(\)](#), and you shall read a counter value from a generated file name in [baseName\(\)](#).

Implements [Digikam::VersionNamingScheme](#).

### 6.362.1.5 intermediateDirectory()

```
QString Digikam::DefaultVersionNamingScheme::intermediateDirectory (
    const QString & currentPath,
    const QString & fileName ) [override], [virtual]
```

Implements [Digikam::VersionNamingScheme](#).

### 6.362.1.6 intermediateFileName()

```
QString Digikam::DefaultVersionNamingScheme::intermediateFileName (
    const QString & path,
    const QString & filename,
    const QVariant & version,
    const QVariant & counter ) [override], [virtual]
```

Creates a version file name for an intermediate file in given directory, as previously returned by [directory\(\)](#), given *baseName*, as previously returned by *baseName*, *version* and intermediate number counter. Do not append a file suffix. You do not need to check if the file exists.

Implements [Digikam::VersionNamingScheme](#).

### 6.362.1.7 versionFileName()

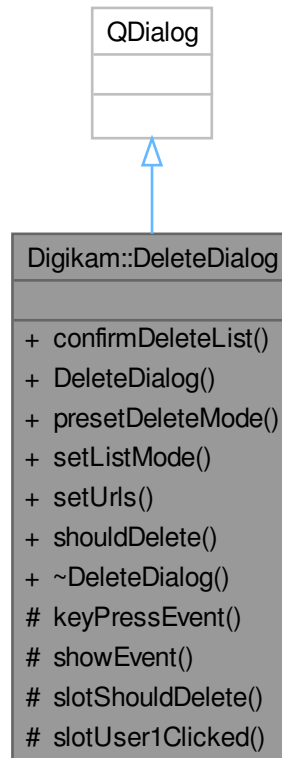

```
QString Digikam::DefaultVersionNamingScheme::versionFileName (
    const QString & path,
    const QString & baseName,
    const QVariant & counter ) [override], [virtual]
```

Creates a version file name for a file in given directory, as previously returned by [directory\(\)](#), given *baseName*, as previously returned by *baseName*, and *version* counter. Do not append a file suffix. You do not need to check if the file exists.

Implements [Digikam::VersionNamingScheme](#).

## 6.377.1 Member Enumeration Documentation

### 6.377.1.1 DisplayFlag

enum [Digikam::DFontProperties::DisplayFlag](#)

- [FixedFontsOnly](#) only show fixed fonts, excluding proportional fonts
- [DisplayFrame](#) show a visual frame around the chooser
- [ShowDifferences](#) display the font differences interfaces

### 6.377.1.2 FontColumn

enum `Digikam::DFontProperties::FontColumn`

- `FamilyList` - Identifies the family (leftmost) list.
- `StyleList` - Identifies the style (center) list.
- `SizeList` - Identifies the size (rightmost) list.

### 6.377.1.3 FontDiff

enum `Digikam::DFontProperties::FontDiff`

- `FontDiffFamily` - Identifies a requested change in the font family.
- `FontDiffStyle` - Identifies a requested change in the font style.
- `FontDiffSize` - Identifies a requested change in the font size.

### 6.377.1.4 FontListCriteria

enum `Digikam::DFontProperties::FontListCriteria`

The selection criteria for the font families shown in the dialog.

- `FixedWidthFont` when included only fixed-width fonts are returned. The fonts where the width of every character is equal.
- `ScalableFont` when included only scalable fonts are returned; certain configurations allow bitmap fonts to remain unscaled and thus these fonts have limited number of sizes.
- `SmoothScalableFont` when included only return smooth scalable fonts. this will return only non-bitmap fonts which are scalable to any size requested. Setting this option to true will mean the "scalable" flag is irrelevant.

## 6.377.2 Constructor & Destructor Documentation

### 6.377.2.1 DFontProperties()

```
Digikam::DFontProperties::DFontProperties (
    QWidget *const parent = nullptr,
    const DisplayFlags & flags = DisplayFrame,
    const QStringList & fontList = QStringList(),
    int visibleListSize = 8,
    Qt::CheckState *const sizeIsRelativeState = nullptr ) [explicit]
```

Constructs a font picker widget. It normally comes up with all font families present on the system; the `getFont` method below does allow some more fine-tuning of the selection of fonts that will be displayed in the dialog.

## Parameters

<i>parent</i>	The parent widget.
<i>flags</i>	Defines how the font chooser is displayed.

## See also

DisplayFlags

## Parameters

<i>fontList</i>	A list of fonts to display, in XLFD format.
<i>visibleListSize</i>	The minimum number of visible entries in the fontlists.
<i>sizelsRelativeState</i>	If not zero the widget will show a checkbox where the user may choose whether the font size is to be interpreted as relative size. Initial state of this checkbox will be set according to *sizelsRelativeState, user choice may be retrieved by calling sizelsRelative().

**6.377.2.2 ~DFontProperties()**

```
Digikam::DFontProperties::~~DFontProperties ( ) [override]
```

Destructs the font chooser.

**6.377.3 Member Function Documentation****6.377.3.1 backgroundColor()**

```
QColor Digikam::DFontProperties::backgroundColor ( ) const
```

## Returns

The background color currently used in the preview (default: the base color of the active colorgroup)

## Parameters

<i>list</i>	The list is returned here.
<i>fontListCriteria</i>	should contain all the restrictions for font selection as OR-ed values

## See also

[DFontProperties::FontListCriteria](#) for the individual values

### 6.377.3.8 makeColumnVisible()

**6.377.3.14 setSampleText()**

```
void Digikam::DFontProperties::setSampleText (
    const QString & text )

## 6.385.1 Member Function Documentation

### 6.385.1.1 `updateRects()`

```
void Digikam::DigikamItemDelegate::updateRects ( ) [override], [protected], [virtual]
```

In a subclass, you need to implement this method to set up the rects for drawing. The `paint()` method operates depending on these rects.

Implements [Digikam::ItemDelegate](#).

Reimplemented in [Digikam::ItemFaceDelegate](#).

## 6.387.1 Member Function Documentation

### 6.387.1.1 activated()

```
void Digikam::DigikamItemView::activated (
    const ItemInfo & info,
    Qt::KeyboardModifiers modifiers ) [override], [protected], [virtual]
```

Reimplemented from [Digikam::ItemCategorizedView](#).

### 6.387.1.2 confirmFaces

```
void Digikam::DigikamItemView::confirmFaces (
    const QList< QModelIndex > & indexes,
    int tagId ) [slot]
```

Confirm the face with a face tag (name) in the database. You aren't allowed to "confirm" a person as Ignored. Marking as Ignored is treated as a changeTag() operation.

### 6.387.1.3 hasHiddenGroupedImages()

```
bool Digikam::DigikamItemView::hasHiddenGroupedImages (
    const ItemInfo & ) const [override], [protected], [virtual]
```

Reimplemented from [Digikam::GroupingViewImplementation](#).

### 6.387.1.4 ignoreFaces

```
void Digikam::DigikamItemView::ignoreFaces (
    const QList< QModelIndex > & indexes ) [slot]
```

Set Face to Ignore ID.

### 6.387.1.5 rejectFaces

```
void Digikam::DigikamItemView::rejectFaces (
    const QList< QModelIndex > & indexes ) [slot]
```

This slot is connected to the reject signal of [AssignNameOverlay](#), and handles two cases.

If reject is done on an Unknown Face, it will mark the face as Ignored.

If reject is done on Unconfirmed suggestions, the suggestion is rejected and the face is marked as Unknown.

### 6.387.1.6 removeFaces

```
void Digikam::DigikamItemView::removeFaces (
    const QList< QModelIndex > & indexes ) [slot]
```

Removes the face from the database. You will have to run face detection again, to recover the face.

### 6.387.1.7 setThumbnailSize()

```
void Digikam::DigikamItemView::setThumbnailSize (
    const ThumbnailSize & size ) [override], [virtual]
```

Reimplemented from [Digikam::ItemCategorizedView](#).

### 6.387.1.8 showContextMenu()

```
void Digikam::DigikamItemView::showContextMenu (
    QContextMenuEvent * event ) [override], [protected], [virtual]
```

Reimplemented from [Digikam::ItemViewCategorized](#).

### 6.387.1.9 showContextMenuOnInfo()

```
void Digikam::DigikamItemView::showContextMenuOnInfo (
    QContextMenuEvent * event,
    const ItemInfo & info ) [override], [protected], [virtual]
```

Reimplemented from [Digikam::ItemCategorizedView](#).

### 6.387.1.10 slotSetupChanged()

```
void Digikam::DigikamItemView::slotSetupChanged ( ) [override], [protected], [virtual]
```

Reimplemented from [Digikam::ItemViewCategorized](#).

### 6.387.1.11 unknownFaces

```
void Digikam::DigikamItemView::unknownFaces (
    const QList< QModelIndex > & indexes ) [slot]
```

Ignored Face back to Unknown face.

void Digikam::DImageHistory::adjustReferredImages ( )
```

Adjusts the type of a Current [HistoryImageId](#): If it is the first entry, it becomes Original, if it is in an intermediate entry, it becomes Intermediate, if in the last entry, it stays current.

### 6.389.1.2 `clearReferredImages()`

```
void Digikam::DImageHistory::clearReferredImages ( )
```

Edit referred images

### 6.389.1.3 `entries()`

```
QList< DImageHistory::Entry > & Digikam::DImageHistory::entries ( )
```

Access entries. There are [size\(\)](#) entries.

### 6.389.1.4 `hasActions()`

```
bool Digikam::DImageHistory::hasActions ( ) const
```

Access actions.

There is one action per entry, but the action may be null.

### 6.389.1.5 `isEmpty()`

```
bool Digikam::DImageHistory::isEmpty ( ) const
```

A history is considered empty if there are no entries.

### 6.389.1.6 `isNull()`

```
bool Digikam::DImageHistory::isNull ( ) const
```

A history is null if it is constructed with the default constructor

### 6.389.1.7 isValid()

```
bool Digikam::DImageHistory::isValid ( ) const
```

A history is a valid history (telling something about the past), if the history is not empty, and there is at least one referred image other than the "Current" entry, or there is a valid action.

### 6.389.1.8 moveCurrentReferredImage()

```
void Digikam::DImageHistory::moveCurrentReferredImage (
    const QString & newPath,
    const QString & newFileName )
```

Change file path entries of the current referred image

### 6.389.1.9 operator<<() [1/2]

```
DImageHistory & Digikam::DImageHistory::operator<< (
    const FilterAction & action )
```

Appends a new filter action to the history.

### 6.389.1.10 operator<<() [2/2]

```
DImageHistory & Digikam::DImageHistory::operator<< (
    const HistoryImageId & imageId )
```

Appends a new referred image, representing the current state of the history. If you add an id of type Current, [adjustReferredImages\(\)](#) will be called.

### 6.389.1.11 purgePathFromReferredImages()

```
void Digikam::DImageHistory::purgePathFromReferredImages (
    const QString & path,
    const QString & fileName )
```

Remove file path entries pointing to the given absolute path from any referred images. This is useful when said file is about to be overwritten. All other [HistoryImageId](#) fields remain unchanged, no [HistoryImageId](#) is removed. path: directory path, without filename.

### 6.389.1.12 referredImages()

```
QList< HistoryImageId > & Digikam::DImageHistory::referredImages (
    int i )
```

Access referred images

### 6.389.1.13 toXml()

```
QString Digikam::DImageHistory::toXml ( ) const
```

Serialize to and from XML.

Note: The "Current" entry is skipped when writing to XML, so make sure the file into the metadata of which you write the XML, is the file marked as "Current" in this history.

## 6.390 Digikam::DImageHistory::Entry Class Reference

### Public Attributes

- [FilterAction](#) `action`
- `QList< HistoryImageId >` `referredImages`

### 6.390.1 Member Data Documentation

#### 6.390.1.1 action

```
FilterAction Digikam::DImageHistory::Entry::action
```

A [DImageHistory](#) is a list of entries.

Each entry has one action. The action can be null, but it shall be null only if it is the action of the first entry, with the "Original" as referred image, representing the action of digitization.

There can be zero, one or any number of referred images per entry. A referred image is a file in the state after the action is applied.

## 6.391.1 Member Enumeration Documentation

### 6.391.1.1 FORMAT

```
enum Digikam::DImg::FORMAT
```

#### Enumerator

QIMAGE	QImage or ImageMagick.
--------	------------------------

### 6.391.1.2 PrepareMetadataFlag

```
enum Digikam::DImg::PrepareMetadataFlag
```

When saving, several changes to the image metadata are necessary before it can safely be written to the new file. This method updates the stored meta engine object in preparation to a subsequent call to `save()` with the same target file. 'intendedDestPath' is the finally intended file name. Do not give the temporary file name if you are going to `save()` to a temp file. 'destMimeType' is destination type mime. In some cases, metadata is updated depending on this value. 'originalFileName' is the original file's name, for simplistic history tracking in metadata. This is completely independent from the [DImageHistory](#) framework. For the 'flags' see below. Not all steps are optional and can be controlled with flags.

## Enumerator

RemoveOldMetadataPreviews	A small preview can be stored in the metadata. Remove old preview entries
CreateNewMetadataPreview	Create a new preview from current image data.
ResetExifOrientationTag	Set the exif orientation tag to "normal" Applicable if the image data was rotated according to the tag
CreateNewImageHistoryUUID	Creates a new UUID for the image history. Applicable if the file was changed.

## 6.391.2 Constructor & Destructor Documentation

### 6.391.2.1 DImg() [1/6]

```
DigiKam::DImg::DImg ( )
```

Create null image

[DImg](#) is a framework to support 16bits color depth image. it doesn't aim to be a complete imaging library; it uses QImage/ImageMagick for load/save files which are not supported natively by it. some of the features:

- Native Image Loaders, for some imageformats which are of interest to us: JPEG (complete), TIFF (mostly complete), PNG (complete), JPEG2000 (complete), RAW (complete through libraw), PGF (complete). For the rest ImageMAGick codecs or qimageloader are used.
- Metadata preservation: when a file is loaded, its metadata like XMP, IPTC, EXIF, JFIF are read and held in memory. now when you save back the file to the original file or to a different file, the metadata is automatically written. All is delegate to Exiv2 library.
- Explicitly Shared Container format (see qt docs): this is necessary for performance reasons.
- 8 bits and 16 bits support: if the file format is 16 bits, it will load up the image in 16bits format (TIFF/PNG/↔ JPEG2000/RAW/PGF support) and all operations are done in 16 bits format, except when the rendering to screen is done, when its converted on the fly to a temporary 8 bits image and then rendered.
- Basic image manipulation: rotate, flip, color modifications, crop, scale. This has been ported from Imlib2 with 16 bits scaling support and support for scaling of only a section of the image.
- Rendering to Pixmap: using QImage/QPixmap. (see above for rendering of 16 bits images).
- Pixel format: the pixel format is different from QImage pixel format. In QImage the pixel data is stored as unsigned ints and to access the individual colors you need to use bit-shifting to ensure endian correctness. in [DImg](#), the pixel data is stored as unsigned char. the color layout is B,G,R,A (blue, green, red, alpha)

for 8 bits images: you can access individual color components like this:

```
uchar* const pixels = image.bits();
```

```
for (int i = 0 ; i < image.width() * image.height() ; ++i) { pixel[0] // blue pixel[1] // green pixel[2] // red pixel[3] // alpha
pixel += 4; // go to next pixel }
```

and for 16 bits images:

```
ushort* const pixels = (ushort*)image.bits();
```

```
for (int i = 0 ; i < image.width() * image.height() ; ++i) { pixel[0] // blue pixel[1] // green pixel[2] // red pixel[3] // alpha
pixel += 4; // go to next pixel }
```

The above is true for both big and little endian platforms. What this also means is that the pixel format is different from that of QImage for big endian machines. Functions are provided if you want to get a copy of the [DImg](#) as a QImage.

### 6.391.2.2 DImg() [2/6]

```
Digikam::DImg::DImg (
    const QByteArray & filePath,
    DImgLoaderObserver *const observer = nullptr,
    const DRawDecoding & rawDecodingSettings = DRawDecoding() ) [explicit]
```

Load image using QByteArray as file path

### 6.391.2.3 DImg() [3/6]

```
Digikam::DImg::DImg (
    const QString & filePath,
    DImgLoaderObserver *const observer = nullptr,
    const DRawDecoding & rawDecodingSettings = DRawDecoding() ) [explicit]
```

Load image using QString as file path

### 6.391.2.4 DImg() [4/6]

```
Digikam::DImg::DImg (
    const DImg & image )
```

Copy image: Creates a shallow copy that refers to the same shared data. The two images will be equal. Call [detach\(\)](#) or [copy\(\)](#) to create deep copies.

### 6.391.2.5 DImg() [5/6]

```
Digikam::DImg::DImg (
    const QImage & image ) [explicit]
```

Copy image: Creates a copy of a QImage object. If the QImage is null, a null [DImg](#) will be created.

### 6.391.2.6 DImg() [6/6]

```
Digikam::DImg::DImg (
    uint width,
    uint height,
    bool sixteenBit,
    bool alpha = false,
    uchar *const data = nullptr,
    bool copyData = true )
```

Create image from data. If data is 0, a new buffer will be allocated, otherwise the given data will be used: If copydata is true, the data will be copied to a newly allocated buffer. If copyData is false, this [DImg](#) object will take ownership of the data pointer. If there is an alpha channel, the data shall be in non-premultiplied form (unassociated alpha).

## 6.391.3 Member Function Documentation

### 6.391.3.1 addAsReferredImage()

```
HistoryImageId Digikam::DImg::addAsReferredImage (
    const QString & filePath,
    HistoryImageId::Type type = HistoryImageId::Intermediate )
```

If you have saved this [DImg](#) to filePath, and want to continue using this [DImg](#) object to add further changes to the image history, you can call this method to add to the image history a reference to the just saved image. First call [updateMetadata\(\)](#), then call [save\(\)](#), then call [addAsReferredImage\(\)](#). Do not call this directly after loading, before applying any changes: The history is correctly initialized when loading. If you need to insert the referred file to an entry which is not the last entry, which may happen if the added image was saved after this image's history was created, you can use [insertAsReferredImage](#). The added id is returned.

### 6.391.3.2 addCurrentUniqueImageId()

```
void Digikam::DImg::addCurrentUniqueImageId (
    const QString & uuid )
```

In the history, adjusts the UUID of the ImageHistoryId of the current file. Call this if you have associated a UUID with this file which is not written to the metadata. If there is already a UUID present, read from metadata, it will not be replaced.

### 6.391.3.3 bitBlendImage()

```
void Digikam::DImg::bitBlendImage (
    DColorComposer *const composer,
    const DImg *const src,
    int sx,
    int sy,
    int w,
    int h,
    int dx,
    int dy,
    DColorComposer::MultiplicationFlags multiplicationFlags = DColorComposer::NoMultiplication
)
```

Blend src image on this image (this is dest) with the specified composer and multiplication flags. See documentation of [DColorComposer](#) for more info. For the other arguments, see documentation of [bitBlendImage](#) above.

### 6.391.3.4 bitBlendImageOnColor()

```
void Digikam::DImg::bitBlendImageOnColor (
    DColorComposer *const composer,
    const DColor & color,
    int x,
    int y,
    int w,
    int h,
    DColorComposer::MultiplicationFlags multiplicationFlags = DColorComposer::NoMultiplication
)
```

For the specified region, blend this image on the given color with the specified composer and multiplication flags. See documentation of [DColorComposer](#) for more info. Note that the result pixel is again written to this image, which is, for the blending, source.

### 6.391.3.5 bitBltImage()

```
void Digikam::DImg::bitBltImage (
    const DImg *const src,
    int dx,
    int dy )
```

Copy a region of pixels from a source image to this image. Parameters: sx|sy Coordinates in the source image of the rectangle to be copied w h Width and height of the rectangle (Default, or when both are -1: whole source image) dx|dy Coordinates in this image of the rectangle in which the region will be copied (Default: 0|0) The bit depth of source and destination must be identical.

### 6.391.3.6 bitsDepth()

```
int Digikam::DImg::bitsDepth ( ) const
```

Return the number of bits depth of one color component for one pixel : 8 (non sixteenBit) or 16 (sixteen)

### 6.391.3.7 bytesDepth()

```
int Digikam::DImg::bytesDepth ( ) const
```

Return the number of bytes depth of one pixel : 4 (non sixteenBit) or 8 (sixteen)

### 6.391.3.8 colorModelToString()

```
QString Digikam::DImg::colorModelToString (
    COLORMODEL colorModel ) [static]
```

Helper method to translate enum values to user presentable strings

### 6.391.3.9 convertDepth()

```
void Digikam::DImg::convertDepth (
    int depth )
```

Convert depth of image. Depth is bytesDepth \* bitsDepth. If depth is 32, converts to 8 bits, if depth is 64, converts to 16 bits.

### 6.391.3.10 convertToSixteenBit()

```
void Digikam::DImg::convertToSixteenBit ( )
```

Wrapper methods for convertDepth

### 6.391.3.11 copy() [1/2]

```
DImg Digikam::DImg::copy ( ) const
```

Return a deep copy of full image

### 6.391.3.12 copy() [2/2]

```
DImg Digikam::DImg::copy (
    const QRect & rect ) const
```

Return a region of image

### 6.391.3.13 copyImageData()

```
DImg Digikam::DImg::copyImageData ( ) const
```

Return a deep copy of the image, but do not include metadata.

### 6.391.3.14 copyMetaData()

```
DImg Digikam::DImg::copyMetaData ( ) const
```

Return an image that contains a deep copy of this image's metadata and the information associated with the image data (width, height, hasAlpha, sixteenBit), but no image data, i.e. `isNull()` is true.

### 6.391.3.15 copyQImage()

```
QImage Digikam::DImg::copyQImage ( ) const
```

QImage wrapper methods

### 6.391.3.16 createHistoryImageId()

```
HistoryImageId Digikam::DImg::createHistoryImageId (
    const QString & filePath,
    HistoryImageId::Type type )
```

Create a [HistoryImageId](#) for *this* image *already* saved at the given file path.

### 6.391.3.17 createImageUniqueId()

```
QByteArray Digikam::DImg::createImageUniqueId ( )
```

This method creates a new 256-bit UUID meant to be globally unique. The UUID will be returned as a 64-byte hexadecimal string. At least 128bits of the UUID will be created by the platform random number generator. The rest may be created from a content-based hash similar to the `uniqueHash`, see above. This method only generates a new UUID for this image without in any way changing this image object or saving the UUID anywhere.

### 6.391.3.18 crop()

```
void Digikam::DImg::crop (
    const QRect & rect )
```

Crop image to the specified region

### 6.391.3.19 detach()

```
void Digikam::DImg::detach ( )
```

Detaches from shared data and makes sure that this image is the only one referring to the data. If multiple images share common data, this image makes a copy of the data and detaches itself from the sharing mechanism. Nothing is done if there is just a single reference.

### 6.391.3.20 detectedFormat()

```
DImg::FORMAT Digikam::DImg::detectedFormat ( ) const
```

Returns the file format in form of the FORMAT enum that was detected in the load() method. Other than the format attribute which is written by the [DImgLoader](#), this can include the QIMAGE or NONE values. Returns NONE for images that have not been loaded. For unknown image formats, a value of QIMAGE can be returned to indicate that the QImage-based loader will have been used. To find out if this has worked, check the return value you got from load().

### 6.391.3.21 exifOrientation()

```
int Digikam::DImg::exifOrientation (
    const QString & filePath )
```

Retrieves the Exif orientation, either from the [LoadSaveThread](#) info provider if available, or from the metadata

### 6.391.3.22 fileFormat()

```
DImg::FORMAT Digikam::DImg::fileFormat (
    const QString & filePath ) [static]
```

Identify file format

### 6.391.3.23 fileOriginData()

```
QVariant Digikam::DImg::fileOriginData ( ) const
```

#### See also

[fileOriginData](#) returns the current origin data, bundled in the returned QVariant.  
[setFileOriginData](#) takes such a variant and adjusts the properties.  
[lastSavedFileOriginData](#) returns the origin data as if the image was loaded from the last saved image.  
[switchOriginToLastSaved](#) is equivalent to setting origin data returned from [lastSavedFileOriginData](#).

For example, an image loaded from a RAW and saved to PNG will be read-only and format RAW. After calling

#### See also

[switchOriginToLastSaved](#), it will not be read-only, [format](#) will be PNG, and [rawDecodingSettings](#) will be null.  
[detectedFormat](#) will not change. In the history, the last referred image that was added (as intermediate) is made the new Current image.

#### Note

Set the saved image path with

#### See also

[imageSavedAs](#) before!

### 6.391.3.24 fill()

```
void Digikam::DImg::fill (
    const DColor & color )
```

Fill whole image with specified color. The bit depth of the color must be identical to the depth of this image.

### 6.391.3.25 format()

```
QString Digikam::DImg::format ( ) const
```

Returns the format string as written by the image loader this image was originally loaded from. Format strings used include JPEG, PNG, TIFF, PGF, JP2K, RAW, PPM. For images loaded with the platform QImage loader, the file suffix is used. Returns null if this [DImg](#) was not loaded from a file, but created in memory.

### 6.391.3.26 getMetadata()

```
MetaEngineData Digikam::DImg::getMetadata ( ) const
```

Metadata manipulation methods

### 6.391.3.27 getPixelColor()

```
DColor Digikam::DImg::getPixelColor (
    uint x,
    uint y ) const
```

Access a single pixel of the image. These functions add some safety checks and then use the methods from [DColor](#). In optimized code working directly on the data, better use the inline methods from [DColor](#).

### 6.391.3.28 getUniqueHash()

```
QByteArray Digikam::DImg::getUniqueHash ( )
```

This methods return a 128-bit MD5 hex digest which is meant to uniquely identify the file. The hash is calculated on parts of the file and the file metadata. It cannot be used to find similar images. It is not calculated from the image data. The hash will be returned as a 32-byte hexadecimal string.

If you already have a [DImg](#) object of the file, use the member method. The object does not need to have the full image data loaded, but it shall at least have been loaded with `loadItemInfo` with `loadMetadata = true`, or have the metadata set later with `setComments`, `setExif`, `setIptc`, `setXmp`. If the object does not have the metadata loaded, a non-null, but invalid hash will be returned! In this case, use the static method. If the image has been loaded with `loadUniqueHash = true`, the hash can be retrieved with the member method.

You do not need a [DImg](#) object of the file to retrieve the unique hash; Use the static method and pass just the file path.

### 6.391.3.29 getUniqueHashVersion()

```
QByteArray Digikam::DImg::getUniqueHashVersion (
    int version )
```

Version 2: This methods return a 128-bit MD5 hex digest which is meant to uniquely identify the file. The hash is calculated on parts of the file. It cannot be used to find similar images. It is not calculated from the image data. The hash will be returned as a 32-byte hexadecimal string.

Version 3: This methods return a 128-bit MD5 hex digest which is meant to uniquely identify the file. It cannot be used to find similar images. The hash is calculated from 6 blocks distributed across the file, the first block has a size of 100 kB (capture metadata), all other possible 5 blocks up to 25 kB. The hash will be returned as a 32-byte hexadecimal string.

If you already have a [DImg](#) object loaded from the file, use the member method. If the image has been loaded with `loadUniqueHash = true`, the hash will already be available.

You do not need a [DImg](#) object of the file to retrieve the unique hash; Use the static method and pass just the file path and version.

### 6.391.3.30 hasTransparentPixels()

```
bool Digikam::DImg::hasTransparentPixels ( ) const
```

If the image has an alpha channel, check if there exist pixels which actually have non-opaque color, that is `alpha < 1.0`. Note that all pixels are scanned to reach a return value of "false". If `hasAlpha()` is false, always returns false.

### 6.391.3.31 imageSavedAs()

```
void Digikam::DImg::imageSavedAs (
    const QString & savePath )
```

It is common that images are not directly saved to the destination path. For this reason, `save()` does not call `addAsReferredImage()`, and the stored save path may be wrong. Call this method after `save()` with the final destination path. This path will be stored in the image history as well.

### 6.391.3.32 isAnimatedImage()

```
bool Digikam::DImg::isAnimatedImage (
    const QString & filePath ) [static]
```

Return true if image file is an animation, as GIFa or NMG

### 6.391.3.33 isReadOnly()

```
bool Digikam::DImg::isReadOnly ( ) const
```

Return true if the original image file format cannot be saved. This is depending of `DImgLoader::save()` implementation. For example RAW file formats are supported by `DImg` using `dcrw` than cannot support writing operations.

### 6.391.3.34 lastSavedFilePath()

```
QString Digikam::DImg::lastSavedFilePath ( ) const
```

Returns the file path to which this `DImg` was saved. Returns the file path set with `imageSavedAs()`, if that was not called, `save()`, if that was not called, a null string.

### 6.391.3.35 loadItemInfo()

```
bool Digikam::DImg::loadItemInfo (
    const QString & filePath,
    bool loadMetadata = true,
    bool loadICCDData = true,
    bool loadUniqueHash = true,
    bool loadImageHistory = true )
```

Loads most parts of the meta information, but never the image data. If `loadMetadata` is true, the metadata will be available with `getComments`, `getExif`, `getIptc`, `getXmp` . If `loadICCDData` is true, the ICC profile will be available with `getICCProfile`.

### 6.391.3.36 operator=()

```
DImg & Digikam::DImg::operator= (
    const DImg & image )
```

Equivalent to the copy constructor

### 6.391.3.37 operator==( )

```
bool Digikam::DImg::operator==(
    const DImg & image ) const
```

Returns whether two images are equal. Two images are equal if and only if they refer to the same shared data. (Thus, `DImg() == DImg()` is not true, both instances refer to their own shared data. `image == DImg(image)` is true.) If two or more images refer to the same data, they have the same image data, `bits()` returns the same data, they have the same metadata, and a change to one image also affects the others. Call `detach()` to split one image from the group of equal images.

### 6.391.3.38 orientation( )

```
int Digikam::DImg::orientation ( ) const
```

Returns current `DMetadata::Orientation` from `DImg`

### 6.391.3.39 originalBitDepth( )

```
int Digikam::DImg::originalBitDepth ( ) const
```

Returns the bit depth (in bits per channel, e.g. 8 or 16) of the original file.

### 6.391.3.40 originalColorModel( )

```
DImg::COLORMODEL Digikam::DImg::originalColorModel ( ) const
```

Returns the color model in which the image was stored in the file. The color space of the loaded image data is always RGB.

### 6.391.3.41 originalFilePath( )

```
QString Digikam::DImg::originalFilePath ( ) const
```

Returns the file path from which this `DImg` was originally loaded. Returns a null string if the `DImg` was not loaded from a file.

### 6.391.3.42 originalRatioSize( )

```
QSize Digikam::DImg::originalRatioSize ( ) const
```

Returns the size of the original file in the same aspect ratio as `size()`.

### 6.391.3.43 originalSize( )

```
QSize Digikam::DImg::originalSize ( ) const
```

Returns the size of the original file.

**6.391.3.44 prepareMetadataToSave()**

```
void Digikam::DImg::prepareMetadataToSave (
    const QString & intendedDestPath,
    const QString & destMimeType,
    bool resetExifOrientationTag )
```

For convenience: Including all flags, except for ResetExifOrientationTag which can be selected. Uses [originalFilePath\(\)](#) to fill the original file name.

**6.391.3.45 pureColorMask()**

```
QImage Digikam::DImg::pureColorMask (
    ExposureSettingsContainer *const expoSettings ) const
```

Return a mask image where pure white and pure black pixels are over-colored. This way is used to identify over and under exposed pixels.

**6.391.3.46 putImageData() [1/2]**

```
void Digikam::DImg::putImageData (
    uchar *const data,
    bool copyData = true )
```

Overloaded function, provided for convenience, behaves essentially like the function above if data is not nullptr. Uses current width, height, sixteenBit, and alpha values. If data is nullptr, the current data are deleted and the image is set to null (But metadata are unchanged).

**6.391.3.47 putImageData() [2/2]**

```
void Digikam::DImg::putImageData (
    uint width,
    uint height,
    bool sixteenBit,
    bool alpha,
    uchar *const data,
    bool copyData = true )
```

Replaces image data of this object. Metadata are unchanged. Parameters like constructor above.

**6.391.3.48 rawDecodingSettings()**

```
DRawDecoding Digikam::DImg::rawDecodingSettings ( ) const
```

Returns the [DRawDecoding](#) options that this [DImg](#) was loaded with. If this is not a RAW image or no options were specified, returns [DRawDecoding\(\)](#).

### 6.391.3.49 removeAlphaChannel()

```
void Digikam::DImg::removeAlphaChannel (
    const DColor & destColor )
```

If the image has an alpha channel and transparent pixels, it will be blended on the specified color and the alpha channel will be removed. This is a no-op if [hasTransparentPixels\(\)](#) is false, but this method can be expensive, therefore it is *not* checked inside `removeAlphaChannel()`. (the trivial `hasAlpha()` is checked)

### 6.391.3.50 reset()

```
void Digikam::DImg::reset ( )
```

Reset metadata and image data to null image

### 6.391.3.51 resetMetaData()

```
void Digikam::DImg::resetMetaData ( )
```

Reset metadata, but do not change image data

### 6.391.3.52 resize()

```
void Digikam::DImg::resize (
    int w,
    int h )
```

Set width and height of this image, `smoothScale` it to the given size

### 6.391.3.53 reverseExifRotate()

```
bool Digikam::DImg::reverseExifRotate (
    const QString & filePath )
```

Reverses the previous function

### 6.391.3.54 reverseRotateAndFlip()

```
bool Digikam::DImg::reverseRotateAndFlip (
    int orientation )
```

Reverses the previous function.

### 6.391.3.55 rotateAndFlip()

```
bool Digikam::DImg::rotateAndFlip (
    int orientation )
```

Rotates and/or flip the [DImg](#) according to the given `DMetadata::Orientation`, so that the current state is orientation and the resulting step is normal orientation. Returns true if the image was actually rotated or flipped (e.g. if `ORIENTATION_NORMAL` is given, returns false, because no action is taken).

**6.391.3.56 savedFormat()**

```
QString Digikam::DImg::savedFormat ( ) const
```

Returns the format string of the format that this image was last saved to. An image can be loaded from a file - retrieve that format with [fileFormat\(\)](#) and [loadedFormat\(\)](#) - and can the multiple times be saved to different formats. Format strings used include JPG, PGF, PNG, TIFF and JP2K. If this file was not save, a null string is returned.

**6.391.3.57 setHistoryBranchAfter()**

```
void Digikam::DImg::setHistoryBranchAfter (
    const DImageHistory & historyBeforeBranch,
    bool isBranch = true )
```

Sets a step in the history to constitute the beginning of a branch. Use [setHistoryBranch\(\)](#) to take [getOriginalImageHistory\(\)](#) and set the first added step as a branch. Use [setHistoryBranchForLastSteps\(n\)](#) to start the branch before the last n steps in the history. (Assume the history had 3 steps and you added 2, call [setHistoryBranchForLastSteps\(2\)](#)) Use [setHistoryBranchAfter\(\)](#) if have a copy of the history before branching, the first added step on top of that history will be made a branch.

**6.391.3.58 smoothScale()**

```
DImg Digikam::DImg::smoothScale (
    int width,
    int height,
    Qt::AspectRatioMode aspectRatioMode = Qt::IgnoreAspectRatio ) const
```

Return a version of this image scaled to the specified size with the specified mode. See [QSize](#) documentation for information on available modes

**6.391.3.59 smoothScaleClipped()**

```
DImg Digikam::DImg::smoothScaleClipped (
    int width,
    int height,
    int clipx,
    int clipy,
    int clipwidth,
    int clipheight,
    bool smooth = true ) const
```

Executes the same scaling as [smoothScale\(width, height\)](#), but from the result of this call, returns only the section specified by *clipx*, *clipy*, *clipwidth*, *clipheight*. This is thus equivalent to calling `Dimg scaled = smoothScale(width, height); scaled.crop(clipx, clipy, clipwidth, clipheight);` but potentially much faster. In [smoothScaleSection](#), you specify the source region, here, the result region. It will often not be possible to find *integer* source coordinates for a result region!

### 6.391.3.60 smoothScaleSection()

```
DImg Digikam::DImg::smoothScaleSection (
    int sx,
    int sy,
    int sw,
    int sh,
    int dw,
    int dh ) const
```

Take the region specified by the rectangle *sx|sy*, width and height *sw \* sh*, and scale it to an image with size *dw \* dh*

### 6.391.3.61 stripImageData()

```
uchar * Digikam::DImg::stripImageData ( )
```

Returns the data of this image. Ownership of the buffer is passed to the caller, this image will be null afterwards.

### 6.391.3.62 transform()

```
bool Digikam::DImg::transform (
    int transformAction )
```

Rotates and/or flip the [DImg](#) according to the given transform action, which is a [MetaEngineRotation::TransformAction](#). Returns true if the image was actually rotated or flipped.

### 6.391.3.63 wasExifRotated()

```
bool Digikam::DImg::wasExifRotated ( )
```

Utility to make sure that an image is rotated according to Exif tag. Detects if an image has previously already been rotated: You can call this method more than one time on the same image. Returns true if the image has actually been rotated or flipped. Returns false if a rotation was not needed.

## 6.393.1 Constructor & Destructor Documentation

### 6.393.1.1 DImgChildItem()

```
Digikam::DImgChildItem::DImgChildItem (
    QGraphicsItem *const parent = nullptr ) [explicit]
```

This is a base class for items that are positioned on top of a [GraphicsDImgItem](#), positioned in relative coordinates, i.e. [0;1], on the image. From the set relative size, the [boundingRect\(\)](#) is calculated.

## 6.393.2 Member Function Documentation

### 6.393.2.1 boundingRect()

```
QRectF Digikam::DImgChildItem::boundingRect ( ) const [override]
```

Reimplemented. Returns a rectangle starting at (0,0) (pos() in parent coordinates) and has a size determined by the relative size.

### 6.393.2.2 originalRect()

```
QRect Digikam::DImgChildItem::originalRect ( ) const
```

Returns the position and size in coordinates of the original image. Note that the return value is integer based. At high zoom rates, different values of [relativeRect\(\)](#) or [zoomedRect\(\)](#) may result in the same [originalRect\(\)](#), when one pixel in the original is represented by more than one pixel on screen.

### 6.393.2.3 parentDImgItem()

```
GraphicsDImgItem * Digikam::DImgChildItem::parentDImgItem ( ) const
```

If the parent item is a [GraphicsDImgItem](#), return it, if the parent item is null or of a different class, returns 0.

### 6.393.2.4 positionChanged

```
void Digikam::DImgChildItem::positionChanged ( ) [signal]
```

These signals are emitted in any case when the geometry changed: Either after changing the geometry relative to the original image, or when the size of the parent [GraphicsDImgItem](#) changed (zooming). [positionChanged\(\)](#) is equivalent to listening to [xChanged\(\)](#) and [yChanged\(\)](#).

### 6.393.2.5 positionOnImageChanged

```
void Digikam::DImgChildItem::positionOnImageChanged ( ) [signal]
```

These signals are emitted when the geometry, relative to the original image, of this item has changed. This happens by calling any of the methods above.

### 6.393.2.6 rect()

```
QRectF Digikam::DImgChildItem::rect ( ) const
```

Returns position and size of this item, in coordinates of the parent [DImg](#) with the current zoom. This is the same result as `QRectF(pos(), boundingRect())`, `boundingRect` is virtual and may be overridden by base classes.

### 6.393.2.7 relativeRect()

```
QRectF Digikam::DImgChildItem::relativeRect ( ) const
```

Returns the position and size relative to the [DImg](#) displayed in the parent item. All four values are in the interval [0;1].

### 6.393.2.8 setOriginalPos()

```
void Digikam::DImgChildItem::setOriginalPos (
    const QPointF & posInOriginal )
```

Sets the position and size of this item, in coordinates of the original image. Requires a valid parent item.

### 6.393.2.9 setPos()

```
void Digikam::DImgChildItem::setPos (
    const QPointF & zoomedPos )
```

Sets the position and size of this item, in coordinates of the parent [DImg](#) item. This is accepting unscaled parent coordinates, just like the "normal" [setPos\(\)](#) does. Requires a valid parent item.

### 6.393.2.10 setRectInSceneCoordinates()

```
void Digikam::DImgChildItem::setRectInSceneCoordinates (
    const QRectF & rect )
```

Equivalent to mapping the scene coordinates to the parent item, and calling `setRect()`.

### 6.393.2.11 setRelativePos()

```
void Digikam::DImgChildItem::setRelativePos (
    const QPointF & relativePosition )
```

Sets the position and size of this item, relative to the [DImg](#) displayed in the parent item. The values of `relativePosition` must be in the interval [0;1].

## 6.402.1 Constructor & Destructor Documentation

### 6.402.1.1 [DImgThreadedFilter\(\)](#) [1/3]

```
Digikam::DImgThreadedFilter::DImgThreadedFilter (
    QObject *const parent = nullptr,
    const QString & name = QString() ) [explicit]
```

Constructs a filter without argument. You need to call [setupFilter\(\)](#) and [startFilter\(\)](#) to start the threaded computation. To run filter without to use multithreading, call [startFilterDirectly\(\)](#).

### 6.402.1.2 DImgThreadedFilter() [2/3]

```
Digikam::DImgThreadedFilter::DImgThreadedFilter (
    DImg *const orgImage,
    QObject *const parent,
    const QString & name = QString() )
```

Constructs a filter with all arguments (ready to use). The given original image will be copied. You need to call [startFilter\(\)](#) to start the threaded computation. To run filter without to use multithreading, call [startFilterDirectly\(\)](#).

### 6.402.1.3 DImgThreadedFilter() [3/3]

```
Digikam::DImgThreadedFilter::DImgThreadedFilter (
    DImgThreadedFilter *const master,
    const DImg & orgImage,
    const DImg & destImage,
    int progressBegin = 0,
    int progressEnd = 100,
    const QString & name = QString() ) [protected]
```

Support for chaining two filters as master and thread.

Do not call [startFilter\(\)](#) or [startFilterDirectly\(\)](#) on this. The computation will be started from [initFilter\(\)](#) which you must call from the derived class constructor.

Constructor for slave mode: Constructs a new slave filter with the specified master. The filter will be executed in the current thread. orgImage and destImage will not be copied. Note that the slave is still free to reallocate his destImage. progressBegin and progressEnd can indicate the progress span that the slave filter uses in the parent filter's progress. Any derived filter class that is publicly available to other filters should implement an additional constructor using this constructor.

```

Implemented in [Digikam::FilterActionFilter](#), [Digikam::lccTransformFilter](#), [Digikam::RawProcessingFilter](#), and [Digikam::WBFilter](#).

### 6.402.2.6 finished

```
void Digikam::DImgThreadedFilter::finished (
    bool success ) [signal]
```

Emitted when the computation has completed.

## Parameters

<i>success</i>	True if computation finished without interruption on valid data False if the thread was canceled, or no data is available.
----------------	--

**6.402.2.7 initFilter()**

```
void Digikam::DImgThreadedFilter::initFilter ( ) [protected], [virtual]
```

Start filter operation before threaded method. Must be called by your constructor.

**6.402.2.8 initSlave()**

```
void Digikam::DImgThreadedFilter::initSlave (
    DImgThreadedFilter *const master,
    int progressBegin = 0,
    int progressEnd = 100 ) [protected]
```

Initialize the filter for use as a slave - reroutes progress info to master. Note: Computation will be started from [setupFilter\(\)](#).

**6.402.2.9 modulateProgress()**

```
int Digikam::DImgThreadedFilter::modulateProgress (
    int progress ) [protected], [virtual]
```

This method modulates the progress value from the 0..100 span to the span of this slave. Called by postProgress if master is not null.

**6.402.2.10 multithreadedSteps()**

```
QList< int > Digikam::DImgThreadedFilter::multithreadedSteps (
    int stop,
    int start = 0 ) const
```

This method return a list of steps to process parallelized operation in filter using QtConcurrents API. Usually, start and stop are rows or columns from image to process. By default, whole image will be processed and start value is 0. In this case stop will be last row or column to process. Between range [start,stop], this method will divide by equal steps depending of number of CPU cores available. To be sure that all values will be processed, in case of CPU core division give rest, the last step compensate the difference. See Blur filter loop implementation for example to see how to use this method with QtConcurrents API.

**6.402.2.11 parametersSuccessfullyRead()**

```
bool Digikam::DImgThreadedFilter::parametersSuccessfullyRead ( ) const [virtual]
```

Optional: error handling for readParameters. When readParameters() has been called, this method will return true if the call was successful, and false if not. If returning false, readParametersError() will give an error message. The default implementation always returns success. You only need to reimplement when a filter is likely to fail in a different environment, e.g. depending on availability of installed files. These methods have an undefined return value if readParameters() was not called previously.

Reimplemented in [Digikam::lccTransformFilter](#).

#### 6.402.2.12 postProgress()

```
void Digikam::DImgThreadedFilter::postProgress (
    int progress ) [protected]
```

Emit progress info.

#### 6.402.2.13 progress

```
void Digikam::DImgThreadedFilter::progress (
    int progress ) [signal]
```

Emitted when progress info from the calculation is available.

#### 6.402.2.14 run()

```
void Digikam::DImgThreadedFilter::run ( ) [override], [protected], [virtual]
```

List of threaded operations by filter.

Implements [Digikam::DynamicThread](#).

#### 6.402.2.15 setFilterVersion()

```
void Digikam::DImgThreadedFilter::setFilterVersion (
    int version )
```

Replaying a filter action: Set the filter version. A filter may implement different versions, to preserve image history when the algorithm is changed. Any value set here must be contained in supportedVersions, otherwise this call will be ignored. Default value is 1. (Note: If you intend to *record* a filter action, please look at [FilterAction](#)'s m\_version)

#### 6.402.2.16 setSlave()

```
void Digikam::DImgThreadedFilter::setSlave (
    DImgThreadedFilter *const slave ) [protected]
```

Inform the master that there is currently a slave. At destruction of the slave, call with slave=0.

#### 6.402.2.17 setupAndStartDirectly()

```
void Digikam::DImgThreadedFilter::setupAndStartDirectly (
    const DImg & orgImage,
    DImgThreadedFilter *const master,
    int progressBegin = 0,
    int progressEnd = 100 )
```

Initializes the filter for use as a slave and directly starts computation (in-thread)

### 6.402.2.18 setupFilter()

```
void Digikam::DImgThreadedFilter::setupFilter (
    const DImg & orgImage )
```

You need to call this and then start filter if you used the constructor not setting an original image. The original image's data will not be copied.

### 6.402.2.19 started

```
void Digikam::DImgThreadedFilter::started ( ) [signal]
```

This signal is emitted when image data is available and the computation has started.

### 6.402.2.20 startFilter()

```
void Digikam::DImgThreadedFilter::startFilter ( ) [virtual]
```

Start the threaded computation.

### 6.402.2.21 startFilterDirectly()

```
void Digikam::DImgThreadedFilter::startFilterDirectly ( ) [virtual]
```

Start computation of this filter, directly in this thread.

### 6.402.3.2 m\_master

```

#### 6.402.3.6 m\_slave

`DImgThreadedFilter* Digikam::DImgThreadedFilter::m_slave = nullptr` [protected]

The current slave. Any filter might want to use another filter while processing.

## 6.409.1 Member Enumeration Documentation

### 6.409.1.1 WriteMode

enum `Digikam::DisjointMetadata::WriteMode`

Enumerator

FullWrite	Write all available information
FullWriteIfChanged	Do a full write if and only if <ul style="list-style-type: none"> <li>• metadata fields changed</li> <li>• the changed fields shall be written according to write settings "Changed" in this context means changed by one of the set... methods, the load() methods are ignored for this attribute. This mode allows to avoid write operations when e.g. the user does not want keywords to be written and only changes keywords.</li> </ul>
PartialWrite	Write only the changed parts. Metadata fields which cannot be changed from <a href="#">MetadataHub</a> (photographer ID etc.) will never be written

### 6.411.1 Detailed Description

This class was split from [DisjointMetadata::Private](#) to allow to use the automatic C++ copy constructor ([DisjointMetadata::Private](#) contains a QMutex and is thus non-copyable)

### 6.411.2 Member Enumeration Documentation

#### 6.411.2.1 Status

```
enum Digikam::DisjointMetadataDataFields::Status
```

The status enum describes the result of joining several metadata sets. If only one set has been added, the status is always `MetadataAvailable`. If no set has been added, the status is always `MetadataInvalid`

#### Enumerator

<code>MetadataInvalid</code>	Not yet filled with any value.
<code>MetadataAvailable</code>	Only one data set has been added, or a common value is available.
<code>MetadataDisjoint</code>	No common value is available. For rating and dates, the interval is available.

### 6.414.1 Detailed Description

Provides a drag object with additional information for internal drag&drop

Images can be moved through `ItemDrag`. It is possible to move them on another application which is supported through QT to e.g. copy the images. `digiKam` can use the IDs, if `ItemDrag` is dropped on `digiKam` itself. The urls set via `setUrls()` are used for external drops (k3b, gimp, ...)

### 6.415.1 Detailed Description

[DItemInfo](#) is a class to get item information from host application (Showfoto or digiKam) The interface is re-implemented in host and depend how item information must be retrieved (from a database or by file metadata). The easy way to use this container is given below:

```
// READ INFO FROM HOST -----
```

```
QUrl itemUrl; // The item url that you want to retrieve information. DInfoInterface* hostface; // The host application interface instance.
```

```
DInfoInterface::DInfoMap info = hostface->itemInfo(itemUrl); // First stage is to get the information map from host application. DItemInfo item(info); // Second stage, is to create the DItemInfo instance for this item by url. QString title = item.name(); // Now you can retrieve the title, QString description = item.comment(); // The comment, QDateTime time = item.dateTime(); // The time stamp, etc.
```

```
// WRITE INFO TO HOST -----
```

```
QUrl itemUrl; // The item url that you want to retrieve information. DInfoInterface* hostface; // The host application interface instance.
```

```
DItemInfo item; // Create the DItemInfo instance for this item with an empty internal info map. item.setRating(3); // Store rating to internal info map. item.setColorLabel(1); // Store color label to internal info map. hostface->setItemInfo(url, item.infoMap()); // Update item information to host using internal info map.
```

## 6.416.1 Member Function Documentation

### 6.416.1.1 `appendControlButtonsWidget()`

```
void Digikam::DItemsList::appendControlButtonsWidget (
    QWidget *const widget )
```

Append a extra widget to the end of Control Button layout (as a progress bar for exemple). This method must be call before [setControlButtonsPlacement\(\)](#). Ownership of the widget is not transferred to the DItemList.

### 6.416.1.2 `checkSelection()`

```
bool Digikam::DItemsList::checkSelection ( )
```

a function to check whether an image has been selected or not.

### 6.416.1.3 `loadImagesFromCurrentAlbum()`

```
void Digikam::DItemsList::loadImagesFromCurrentAlbum ( )
```

A function to load all the images from the album if no image has been selected by user.

### 6.416.1.4 `setControlButtonsPlacement()`

```
QBoxLayout * Digikam::DItemsList::setControlButtonsPlacement (
    ControlButtonPlacement placement )
```

Plug the control buttons near to the list, following 'placement' position. Return the instance of the layout supporting the control buttons, if any. This method must be calls after to use [appendControlButtonsWidget\(\)](#).

### 6.416.1.5 `setIsLessThanHandler()`

```
void Digikam::DItemsList::setIsLessThanHandler (
    DItemsListIsLessThanHandler fncptr )
```

Methods to handle function pointer used to customize sort items in list. See `DItemsListIsLessThanHandler` type for details.

### 6.425.1 Member Enumeration Documentation

#### 6.425.1.1 VIDEOCOLORMODEL

enum [Digikam::DMetadata::VIDEOCOLORMODEL](#)

Video color model reported by FFmpeg following XMP DM Spec from Adobe. These values are stored in DB as Image color model properties (extension of [DImg::ColorModel](#))

## 6.425.2 Member Function Documentation

### 6.425.2.1 addToXmpTagStringBag()

```
bool Digikam::DMetadata::addToXmpTagStringBag (
    const char *const xmpTagName,
    const QStringList & entriesToAdd ) const
```

Set an Xmp tag content using a list of strings defined by the 'entriesToAdd' parameter. The existing entries are preserved. The method will compare all new with all already existing entries to prevent duplicates in the image. Return true if the entries have been added to metadata.

### 6.425.2.2 countryCodeMap()

```
DMetadata::CountryCodeMap Digikam::DMetadata::countryCodeMap ( ) [static]
```

Return a map of ISO-639-1 2 letters country codes with country names.

### 6.425.2.3 countryCodeMap2()

```
DMetadata::CountryCodeMap Digikam::DMetadata::countryCodeMap2 ( ) [static]
```

Return a map of ISO-639-2 3 letters country codes with country names.

### 6.425.2.4 getCameraSerialNumber()

```
QString Digikam::DMetadata::getCameraSerialNumber ( ) const
```

Return a string with Camera serial number.

### 6.425.2.5 getCopyrightInformation()

```
bool Digikam::DMetadata::getCopyrightInformation (
    Template & t ) const
```

Fills only the copyright values in the template. Use getMetadataTemplate() usually. Returns true if valid fields were read.

### 6.425.2.6 getIccProfile()

```
IccProfile Digikam::DMetadata::getIccProfile ( ) const
```

Reads an [IccProfile](#) that is described or embedded in the metadata. This method does not retrieve profiles embedded in the image but from the Exif metadata, e.g. embedded profiles in JPEG images. Returns a null profile if no profile is found.

### 6.425.2.7 getItemFacesMap()

```
bool Digikam::DMetadata::getItemFacesMap (
    QMap<QString, QVariant> & facesPath ) const
```

Get Images Face Map based on tags stored in Picassa/Metadatagroup format. Read face tags only if Exiv2 can write them, otherwise garbage tags will be generated on image transformation

### 6.425.2.8 getLensDescription()

```
QString Digikam::DMetadata::getLensDescription ( ) const
```

Return a string with Lens mounted on the front of camera. There no standard Exif tag for Lens information. Camera makernotes and Xmp tags are parsed. Take a care : lens information are not standardized and string content is not homogeneous between camera model/maker. < Canon Cameras Makernote.

### 6.425.2.15 load()

```
bool Digikam::DMetadata::load (
    const QString & filePath,
    bool videoAll = false,
    Backend * backend = nullptr )
```

Re-implemented from [MetaEngine](#) to use `libraw` identify, `libheif`, `ffmpeg` probe, and `ImageMagick` identify methods if `Exiv2` failed. If `backend` is non null, return the backend used to populate metadata (`Exiv2`). See [MetaEngine::Backend](#) enum for details.

#### 6.425.2.16 loadUsingFFmpeg()

```
bool Digikam::DMetadata::loadUsingFFmpeg (
    const QString & filePath )

```
bool Digikam::DMetadata::mSecTimeStamp (
    const char *const exifTagName,
    int & ms ) const
```

```

append a new button to the button area. The button can later on be accessed with button(ID) eg for connecting signals to it

##### Parameters

<i>pic</i>	a icon for the button
<i>id</i>	an arbitrary ID value. It will be emitted in the clicked signal for identifying the button if more than one button is connected to a signals.
<i>popup</i>	A popup menu which should be displayed if the button is clicked
<i>not_used_yet</i>	will be used for a popup text in the future

#### 6.430.3.2 appendTab()

```
void Digikam::DMultiTabBar::appendTab (

```
QList< QString > Digikam::DNNBaseDetectorModel::generateObjects (
    const cv::Mat & inputImage )
```

generateObjects in one image return just the predicted objects without locations of objects using for the assignment tagging names.

### 6.442.1.4 generateObjects() [2/2]

```
QList< QList< QString > > Digikam::DNNBaseDetectorModel::generateObjects (
    const std::vector< cv::Mat > & inputImage )

```

Classify bounding boxes detected. Good bounding boxes are defined as boxes that reside within the non-padded zone or those that are out only for min of (10% of padded range, 10% of bbox dim).

Bad bounding boxes are defined as boxes that have at maximum 25% of each dimension out of non-padded zone.
